Tan, Steinbach, Kumar

## Association Rule Mining

- Given a set of transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

## Market-Basket transactions

| TID | Iterss |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

Example of Association Rules

$$
\{\text { Diaper }\} \rightarrow\{\text { Beer }\},
$$

$$
\{\text { Milk, Bread }\} \rightarrow\{\text { Eggs,Coke }\}
$$

$$
\{\text { Beer, Bread }\} \rightarrow\{\text { Milk }\},
$$

Implication means co-occurrence, not causality!

## Definition: Frequent Itemset

- Itemset
- A collection of one or more items
- Example: \{Milk, Bread, Diaper\}
- k-itemset
- An itemset that contains kitems
- Support count ( $\sigma$ )
- Frequency of occurrence of an itemset
- E.g. $\sigma(\{$ Milk, Bread,Diaper\}) $=2$
- Support
- Fraction of transactions that contain an itemset
- E.g. s(\{Milk, Bread, Diaper\}) $=2 / 5$
- Frequent Itemset
- An itemset whose support is greater
than or equal to a minsup threshold
- An itemset whose support is greater
than or equal to a minsup threshold

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

## Definition: Association Rule

- Association Rule
- An implication expression of the form $X \rightarrow Y$, where $X$ and $Y$ are itemsets
- Example:
\{Milk, Diaper\} $\rightarrow$ \{Beer $\}$
- Rule Evaluation Metrics

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

- Support (s)
- Fraction of transactions that contain both $X$ and $Y$
- Confidence (c)
- Measures how often items in Y appear in transactions that contain X

$$
\begin{aligned}
& s=\frac{\sigma(\text { Milk, Diaper,Beet }}{|T|}=\frac{2}{5}=0.4 \\
& c=\frac{\sigma(\text { Milk,Diaper,Bed })}{\sigma(\text { Milk, Diaper })}=\frac{2}{3}=0.67
\end{aligned}
$$

## Association Rule Mining Task

- Given a set of transactions T, the goal of association rule mining is to find all rules having
- support $\geq$ minsup threshold
- confidence $\geq$ minconf threshold
- Brute-force approach:
- List all possible association rules
- Compute the support and confidence for each rule
- Prune rules that fail the minsup and minconf thresholds
$\Rightarrow$ Computationally prohibitive!

## Mining Association Rules

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

## Example of Rules:

\{Milk,Diaper\} $\rightarrow$ \{Beer\} (s=0.4, c=0.67)
\{Milk,Beer\} $\rightarrow$ \{Diaper\} (s=0.4, c=1.0)
$\{$ Diaper,Beer $\} \rightarrow\{$ Milk $\}(s=0.4, \mathrm{c}=0.67$ )
$\{$ Beer $\} \rightarrow$ \{Milk,Diaper\} (s=0.4, c=0.67)
$\{$ Diaper\} $\rightarrow$ \{Milk,Beer\} (s=0.4, c=0.5)
\{Milk\} $\rightarrow$ \{Diaper,Beer\} (s=0.4, c=0.5)
Observations:

- All the above rules are binary partitions of the same itemset: \{Milk, Diaper, Beer\}
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

## Mining Association Rules

- Two-step approach:

1. Frequent Itemset Generation

- Generate all itemsets whose support $\geq$ minsup

1. Rule Generation

- Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset
- Frequent itemset generation is still computationally expensive

## Frequent Itemset Generation

## Frequent Itemset Generation

- Brute-force approach:
- Each itemset in the lattice is a candidate frequent itemset
- Count the support of each candidate by scanning the database

Transactions

| $T I D$ | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

- Match each transaction against every candidate
- Complexity ~ O(NMw) => Expensive since M = 2d !!!

## Computational Complexity

Given d unique items:

- Total number of itemsets $=2^{\text {d }}$
- Total number of possible association rules:

$$
\begin{aligned}
& R=\sum_{k=1}^{d-1}\left[\binom{d}{k} \times \sum_{j=1}^{d-k}\binom{d-k}{j}\right] \\
& i 3^{d}-2^{d+1}+1
\end{aligned}
$$

If $\mathrm{d}=\mathbf{6}, \mathrm{R}=\mathbf{6 0 2}$ rules

## Frequent Itemset Generation Strategies

- Reduce the number of candidates (M)
- Complete search: $\mathrm{M}=2^{\mathrm{d}}$
- Use pruning techniques to reduce M
- Reduce the number of transactions (N)
- Reduce size of N as the size of itemset increases
- Used by DHP and vertical-based mining algorithms
- Reduce the number of comparisons (NM)
- Use efficient data structures to store the candidates or transactions
- No need to match every candidate against every transaction

## Reducing Number of Candidates

- Apriori principle:
- If an itemset is frequent, then all of its subsets must also be frequent
- Apriori principle holds due to the following property of the support measure:

$$
\forall X, Y:(X \subseteq Y) \Rightarrow s(X) \geq s(Y)
$$

- Support of an itemset never exceeds the support of its subsets
- This is known as the anti-monotone property of support

## Illustrating Apriori Principle

Found to be Infrequent

## Illustrating Apriori Principle

| Item | Count |
| :--- | :---: |
| Bread | Items |
| Coke | $\mathbf{4}$ |
| Milk | $\mathbf{2}$ |
| Beer | $\mathbf{3}$ |
| Diaper | $\mathbf{3}$ |
| Eggs | 1 |

Minimum Support $=3$

| Itemset | Count | Pairs (2-itemsets) <br> (No need to generate candidates involving Coke or Eggs) |  |  |
| :---: | :---: | :---: | :---: | :---: |
| \{Bread,Milk \} | 3 |  |  |  |
| \{Bread,Beer\} | 2 |  |  |  |
| \{Bread,Diaper\} | 3 |  |  |  |
| \{Milk,Beer\} | 2 |  |  |  |
| \{Milk,Diaper\} | 3 |  |  |  |
| \{Beer,Diaper\} | 3 |  |  |  |

Triplets (3-itemsets)
If every subset is considered,

$$
{ }^{6} \mathrm{C}_{1}+{ }^{6} \mathrm{C}_{2}+{ }^{6} \mathrm{C}_{3}=41
$$

| Itemset | Count |
| :--- | :---: |
| \{Bread,Milk,Diaper\} | $\mathbf{3}$ |

With support-based pruning,

$$
6+6+1=13
$$

## Apriori Algorithm

## - Method:

- Let $\mathrm{k}=1$
- Generate frequent itemsets of length 1
- Repeat until no new frequent itemsets are identified
- Generate length $(k+1)$ candidate itemsets from length $k$ frequent itemsets
- Prune candidate itemsets containing subsets of length $k$ that are infrequent
- Count the support of each candidate by scanning the DB
- Eliminate candidates that are infrequent, leaving only those that are frequent

## Reducing Number of Comparisons

## - Candidate counting:

- Scan the database of transactions to determine the support of each candidate itemset
- To reduce the number of comparisons, store the candidates in a hash structure
- Instead of matching each transaction against every candidate, match it against candidates contained in the hashed buckets

Transactions
Hash Structure

Buckets

## Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:
\{1 4 5\}, \{1 2 4\}, \{4 5 7\}, \{1 2 5\}, \{4 5 8\}, \{1 5 9\}, \{1 3 6\}, \{2 3 4\}, \{5 6 7\}, \{3 4 5\},
\{3 5 6\}, \{3 57$\}$, $\{689\}$, $\{367\},\{368\}$
You need:

- Hash function
- Max leaf size: max number of itemsets stored in a leaf node (if number of candidate itemsets exceeds max leaf size, split the node)

## Association Rule Discovery: Hash tree

## Association Rule Discovery: Hash tree

## Association Rule Discovery: Hash tree

## Subset Operation

Given a transaction $t$, what are the possible subsets of size 3 ?

## Subset Operation Using Hash Tree

| © Tan, Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :---: | :---: | :---: |

## Subset Operation Using Hash Tree

| © Tan,Steinbach, Kumar | Introduction to Data Mining |
| :---: | :---: | $4 / 18 / 2004$

## Subset Operation Using Hash Tree

## Factors Affecting Complexity

- Choice of minimum support threshold
- lowering support threshold results in more frequent itemsets
- this may increase number of candidates and max length of frequent itemsets
- Dimensionality (number of items) of the data set
- more space is needed to store support count of each item
- if number of frequent items also increases, both computation and I/O costs may also increase
- Size of database
- since Apriori makes multiple passes, run time of algorithm may increase with number of transactions
- Average transaction width
- transaction width increases with denser data sets
- This may increase max length of frequent itemsets and traversals of hash tree (number of subsets in a transaction increases with its width)

## Compact Representation of Frequent Itemsets

- Some itemsets are redundant because they have identical support as their supersets

| :--- | :--- | :--- |

## ECLAT

## - For each item, store a list of transaction ids (tids)

## ECLAT

- Determine support of any k-itemset by intersecting tid-lists of two of its ( $k-1$ ) subsets.

| A |
| :---: |
| 1 |
| 4 |
| 5 |
| 6 |
| 7 |
| 8 |
| 9 |

| B |
| :---: |
| 1 |
| 2 |
| 5 |
| 7 |
| 8 |
| 10 |

$\longrightarrow$| $A B$ |
| :---: |
| 1 |
| 5 |
| 7 |
| 8 |

- 3 traversal approaches:
- top-down, bottom-up and hybrid
- Advantage: very fast support counting
- Disadvantage: intermediate tid-lists may become too large for memory

## Rule Generation

- Given a frequent itemset L, find all non-empty subsets $f \subset L$ such that $f \rightarrow L-f$ satisfies the minimum confidence requirement
- If $\{A, B, C, D\}$ is a frequent itemset, candidate rules:
$\mathrm{ABC} \rightarrow \mathrm{D}, \mathrm{ABD} \rightarrow \mathrm{C}, \mathrm{ACD} \rightarrow \mathrm{B}, \mathrm{BCD} \rightarrow \mathrm{A}$, $A \rightarrow B C D, B \rightarrow A C D, C \rightarrow A B D, D \rightarrow A B C$ $A B \rightarrow C D, A C \rightarrow B D, A D \rightarrow B C, B C \rightarrow A D$, $B D \rightarrow A C, C D \rightarrow A B$,
- If $\mid$ L $=k$, then there are $2^{k}-2$ candidate association rules (ignoring $L \rightarrow \varnothing$ and $\varnothing \rightarrow L$ )

## Rule Generation

- How to efficiently generate rules from frequent itemsets?
- In general, confidence does not have an anti-monotone property

$$
c(A B \xrightarrow{c(A B C)} \rightarrow D) \text { can be larger or smaller than }
$$

- But confidence of rules generated from the same itemset has an anti-monotone property
- e.g., $L=\{A, B, C, D\}:$
$\mathrm{c}(\mathrm{ABC} \rightarrow \mathrm{D}) \geq \mathrm{c}(\mathrm{AB} \rightarrow \mathrm{CD}) \geq \mathrm{c}(\mathrm{A} \rightarrow \mathrm{BCD})$
- Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

## Rule Generation for Apriori Algorithm

## Lattice of rules

## Rule Generation for Apriori Algorithm

- Candidate rule is generated by merging two rules that share the same prefix in the rule consequent
- join(CD=>AB, $B D=>A C)$ would produce the candidate rule $D=>A B C$
- Prune rule $D=>A B C$ if its
 subset $A D=>B C$ does not have high confidence

## Effect of Support Distribution

- Many real data sets have skewed support distribution

Support distribution of a retail data set

## Effect of Support Distribution

- How to set the appropriate minsup threshold?
- If minsup is set too high, we could miss itemsets involving interesting rare items (e.g., expensive products)
- If minsup is set too low, it is computationally expensive and the number of itemsets is very large
- Using a single minimum support threshold may not be effective

## Multiple Minimum Support

- How to apply multiple minimum supports?
- MS(i): minimum support for item i
- e.g.: MS(Milk)=5\%, MS(Broccoli)=0.1\%, MS(Salmon)=0.5\%
- MS(\{Milk, Broccoli\}) $=$ min (MS(Milk), MS(Broccoli))

$$
=0.1 \%
$$

- Challenge: Support is no longer anti-monotone
- Suppose: Support(Milk, Coke) = 1.5\% and Support(Milk, Coke, Broccoli) $=0.5 \%$
- \{Milk,Coke\} is infrequent but \{Milk,Coke,Broccoli\} is frequent

## Multiple Minimum Support

| Item | MS(I) | Sup(I) |
| :---: | :---: | :---: |
| A | $0.10 \%$ | $0.25 \%$ |
| B | $0.20 \%$ | $0.26 \%$ |
| C | $0.30 \%$ | $0.29 \%$ |
|  |  |  |
| D | $0.50 \%$ | $0.05 \%$ |
|  |  |  |
| E | $3 \%$ | $4.20 \%$ |

## Multiple Minimum Support

| Item | MS(I) | Sup(I) |
| :---: | :---: | :---: |
|  |  |  |
| A | $0.10 \%$ | $0.25 \%$ |
|  |  |  |
| B | $0.20 \%$ | $0.26 \%$ |
|  |  |  |
| C | $0.30 \%$ | $0.29 \%$ |
|  |  |  |
| D | $0.50 \%$ | $0.05 \%$ |
|  |  |  |
| E | $3 \%$ | $4.20 \%$ |

## Multiple Minimum Support (Liu 1999)

- Order the items according to their minimum support (in ascending order)
- e.g.: $\quad$ MS(Milk) $=5 \%, \quad$ MS(Coke) $=3 \%$, MS(Broccoli) $=0.1 \%, \quad$ MS(Salmon) $=0.5 \%$
- Ordering: Broccoli, Salmon, Coke, Milk
- Need to modify Apriori such that:
$-L_{1}$ : set of frequent items
$-F_{1}$ : set of items whose support is $\geq \mathrm{MS}(1)$ where $\mathrm{MS}(1)$ is $\min _{\mathrm{i}}(\mathrm{MS}(\mathrm{i})$ )
- $\mathrm{C}_{2}$ : candidate itemsets of size 2 is generated from $\mathrm{F}_{1}$ instead of $L_{1}$

## Multiple Minimum Support (Liu 1999)

## - Modifications to Apriori:

- In traditional Apriori,
- A candidate $(\mathrm{k}+1)$-itemset is generated by merging two frequent itemsets of size $k$
- The candidate is pruned if it contains any infrequent subsets of size k
- Pruning step has to be modified:
- Prune only if subset contains the first item
e.g.: Candidate=\{Broccoli, Coke, Milk\} (ordered according to minimum support)
- \{Broccoli, Coke\} and \{Broccoli, Milk\} are frequent but \{Coke, Milk\} is infrequent
- Candidate is not pruned because \{Coke,Milk\} does not contain the first item, i.e., Broccoli.

## Pattern Evaluation

- Association rule algorithms tend to produce too many rules
- many of them are uninteresting or redundant
- Redundant if $\{A, B, C\} \rightarrow\{D\}$ and $\{A, B\} \rightarrow\{D\}$ have same support \& confidence
- Interestingness measures can be used to prune/rank the derived patterns
- In the original formulation of association rules, support \& confidence are the only measures used

## Application of Interestingness Measure

## Computing Interestingness Measure

- Given a rule $\mathrm{X} \rightarrow \mathrm{Y}$, information needed to compute rule interestingness can be obtained from a contingency table

Contingency table for $\mathrm{X} \rightarrow \mathrm{Y}$

|  | $Y$ | $T$ |  |
| :---: | :---: | :---: | :---: |
| $X$ | $f_{n}$ | $f_{p}$ | $f_{t}$ |
| $\bar{X}$ | $f_{n}$ | $f_{m}$ | $f_{o r}$ |
|  | $f_{+1}$ | $f_{i 0}$ | $\|T\|$ |

$f_{n}$ : support of $X$ and $Y$
$f_{n}$ : support of $X$ and $\bar{Y}$ $f_{n}$ : support of $X$ and $Y$ $f_{\infty}$ : support of $X$ and $Y$

## Used to define various measures

- support, confidence, lift, Gini, J-measure, etc.

## Drawback of Confidence

|  | Coffee | Coffee |  |
| :---: | :---: | :---: | :---: |
| Tea | 15 | 5 | 20 |
| Tea | 75 | 5 | 80 |
|  | 90 | 10 | 100 |

## Association Rule: Tea $\rightarrow$ Coffee

Confidence $=P($ Coffee $\mid$ Tea $)=0.75$
but $\mathrm{P}($ Coffee $)=0.9$
$\Rightarrow$ Although confidence is high, rule is misleading
$\Rightarrow \mathrm{P}($ Coffee $\mid$ Tea $)=0.9375$

## Statistical Independence

- Population of 1000 students
- 600 students know how to swim (S)
- 700 students know how to bike (B)
- 420 students know how to swim and bike (S,B)
$-P(S \wedge B)=420 / 1000=0.42$
$-P(S) \times P(B)=0.6 \times 0.7=0.42$
$-P(S \wedge B)=P(S) \times P(B)=>$ Statistical independence
- $P(S \wedge B)>P(S) \times P(B)=>$ Positively correlated
- $P(S \wedge B)<P(S) \times P(B)=>$ Negatively correlated

## Statistical-based Measures

- Measures that take into account statistical dependence

$$
\begin{aligned}
& \text { Lift }=\frac{P(Y \mid X)}{P(Y)} \\
& \text { Intere }=\frac{P(X, Y)}{P(X) P(Y)} \\
& P S=P(X, Y)-P(X) P(Y) \\
& \varphi \text {-coefficie } \frac{P(X, Y)-P(X) P(Y)}{\sqrt{P(X)[1-P(X)] P(Y)[1-P(Y)]}}
\end{aligned}
$$

## Example: Lift/Interest

|  | Coffee | Coffee |  |
| :---: | :---: | :---: | :---: |
| Tea | 15 | 5 | 20 |
| Tea | 75 | 5 | 80 |
|  | 90 | 10 | 100 |

## Association Rule: Tea $\rightarrow$ Coffee

Confidence $=P($ Coffee $\mid$ Tea $)=0.75$
but $\mathrm{P}($ Coffee $)=0.9$
$\Rightarrow$ Lift $=0.75 / 0.9=0.8333(<1$, therefore is negatively associated)

## Drawback of Lift \& Interest

|  | Y | $\bar{Y}$ |  |
| :---: | :---: | :---: | :---: |
| X | 10 | 0 | 10 |
| $\bar{Z}$ | 0 | 90 | 90 |
|  | 10 | 90 | 100 |

Lift $\frac{0.1}{(0.1)(0.1)}=10$

|  | Y | $\overline{\mathrm{P}}$ |  |
| :---: | :---: | :---: | :---: |
| X | 90 | 0 | 90 |
| Z | 0 | 10 | 10 |
|  | 90 | 10 | 100 |

Lifた $=\frac{0.9}{(0.9)(0.9)}=1.11$

Statistical independence:
If $P(X, Y)=P(X) P(Y)=>$ Lift $=1$

## There are lots of measures proposed in the literature

Some measures are good for certain applications, but not for others

What criteria should we use to determine whether a measure is good or bad?

What about Aprioristyle support based pruning? How does it affect these measures?

| \# | Measure | Formula |
| :---: | :---: | :---: |
| 1 | $\phi$-coefficient | $\frac{P(A, B)-P(A) P(B)}{}$ |
| 2 | Goodman-Kruskal's ( $\lambda$ ) | $\begin{aligned} & \sqrt{P(A) P(B)(1-P(A))(1-P(B))} \\ & \sum_{j} \max _{k} P\left(A_{j}, B_{k}\right)+\sum_{k} \max _{j} P\left(A_{j}, B_{k}\right)-\max _{j} P\left(A_{j}\right)-\max _{k} P\left(B_{k}\right) \end{aligned}$ |
| 2 | Goodman-Kruskal's ( $\lambda$ ) |  |
| 3 | Odds ratio ( $\alpha$ ) | $\frac{P(A, B) P(\bar{A}, \bar{B})}{P(A, \bar{B}) P(\overline{\bar{A}}, \bar{B})}$ |
| 4 | Yule's $Q$ | $\frac{P(A, B) P\left(\frac{A,}{A B}\right)-P(A, \bar{B}) P(\bar{A}, B)}{P(A, B) P(\overline{A B})+P(A, \bar{B}) P(\bar{A}, B)}=\frac{\alpha-1}{\alpha+1}$ |
|  |  | $\begin{aligned} & P(A, B) P(\overline{A B})+P(A, \bar{B}) P(\bar{A}, B) \\ & \sqrt{P(A, B) P(\overline{A B})}-\sqrt{P(A, \bar{B}) P(\bar{A}, B)} \\ & \sqrt{\alpha+1} \end{aligned}$ |
| 5 | Yule's $Y$ | $\frac{P(A, B) P(A \bar{B}}{\sqrt{P(A, B) P(\overline{A B})}+\sqrt{P(A, \bar{B}) P(\bar{A}, \underline{B})}}=\frac{\sqrt{\alpha}-1}{\sqrt{\alpha}+1}$ |
| 6 | Kappa ( $\kappa$ ) | $\frac{P(A, B)+P(\bar{A}, \bar{B})-P(A) P(B)-P(\bar{A}) P(\bar{B})}{\left.1-P(A) P(B)-P(\bar{A}) P(\bar{B})_{A_{i}}, B_{j}\right)}$ |
| 7 | Mutual Information (M) | $\frac{\sum_{i} \sum_{j} P\left(A_{i}, B_{j}\right) \log \frac{P\left(A_{i}\right) P\left(B_{j}\right)}{\min \left(-\sum_{i} P\left(A_{i}\right) \log P\left(A_{i}\right),-\sum_{j} P\left(B_{j}\right) \log P\left(B_{j}\right)\right)}}{\text { 隹 }}$ |
| 8 | J-Measure ( $J$ ) | $\begin{array}{r} \max \left(P(A, B) \log \left(\frac{P(B \mid A)}{P(B)}\right)+P(A \bar{B}) \log \left(\frac{P(\bar{B} \mid A)}{P(\bar{B})}\right),\right. \\ \left.P(A, B) \log \left(\frac{P(A \mid B)}{P(A)}\right)+P(\bar{A} B) \log \left(\frac{P(\bar{A} \mid B)}{P(\bar{A})}\right)\right) \end{array}$ |
| 9 | Gini index (G) | $\begin{aligned} & \max \left(P(A)\left[P(B \mid A)^{\mathrm{a}}+P(\bar{B} \mid A)^{\mathrm{a}}\right]+P(\bar{A})\left[P(B \mid \bar{A})^{\mathrm{a}}+P(\bar{B} \mid \bar{A})^{\mathrm{a}}\right]\right. \\ & \quad-P(B)^{\mathrm{a}}-P(\bar{B})^{\mathrm{a}} \\ & P(B)\left[P(A \mid B)^{\mathrm{a}}+P(\bar{A} \mid B)^{\mathrm{a}}\right]+P(\bar{B})\left[P(A \mid \bar{B})^{\mathrm{a}}+P(\bar{A} \mid \bar{B})^{\mathrm{a}}\right] \\ & \left.\quad-P(A)^{\mathrm{a}}-P(\bar{A})^{\mathrm{a}}\right) \end{aligned}$ |
| 10 | Support (s) | $P(A, B)$ |
| 11 | Confidence (c) | $\max (P(B \mid A), P(A \mid B))$ |
| 12 | Laplace (L) | $\max \left(\frac{N P(A, B)+1}{N P(A)+\mathbf{a}}, \frac{N P(A, B)+1}{N P(B)+\mathbf{a}}\right)$ |
| 13 | Conviction (V) | $\max \left(\frac{P(A) P(\bar{B})}{P(A \bar{B})}, \frac{P(B) P(\bar{A})}{P(B \bar{A})}\right)$ |
| 14 | Interest ( $I$ ) | $\frac{P(A, B)}{P(A) P(B)}$ |
| 15 | cosine ( $I S$ ) | $\frac{P(A, B)}{\sqrt{P(A) P(B)}}$ |
| 16 | Piatetsky-Shapiro's (PS) | $P(A, B)-P(A) P(B)$ |
| 17 | Certainty factor (F) | $\max \left(\frac{P(B \mid A)-P(B)}{1-P(B)}, \frac{P(A \mid B)-P(A)}{1-P(A)}\right)$ |
| 18 | Added Value ( $A V$ ) | $\max (P(B \mid A)-P(B), P(A \mid B)-P(A))$ |
| 19 | Collective strength ( $S$ ) | $\frac{P(A, B)+P(\overline{A B})}{P(A) P(B)+P(\bar{A}) P(\bar{B})} \times \frac{1-P(A) P(B)-P(\bar{A}) P(\bar{B})}{1-P(A, B)-P(\overline{A B})}$ |
| 20 | Jaccard ( $\zeta$ ) | $\frac{P(A, B)}{P(A)+P(B)-P(A, B)}$ |
| 21 | Klosgen (K) | $\sqrt{P(A, B)} \max (P(B \mid A)-P(B), P(A \mid B)-P(A))$ |

## Properties of A Good Measure

- Piatetsky-Shapiro:

3 properties a good measure $M$ must satisfy:
$-M(A, B)=0$ if $A$ and $B$ are statistically independent

- $M(A, B)$ increase monotonically with $P(A, B)$ when $P(A)$ and $P(B)$ remain unchanged
- $M(A, B)$ decreases monotonically with $P(A)$ [or $P(B)]$ when $P(A, B)$ and $P(B)$ [or $P(A)]$ remain unchanged

## Comparing Different Measures

10 examples of contingency tables:

Rankings of contingency tables using various measures:

| Example | $\mathbf{f}_{\mathbf{1 1}}$ | $\mathbf{f}_{\mathbf{1 0}}$ | $\mathbf{f}_{\mathbf{0 1}}$ | $\mathbf{f}_{\mathbf{0 0}}$ |
| :---: | :---: | :---: | :---: | :---: |
| E1 | 8123 | 83 | 424 | 1370 |
| E2 | 8330 | 2 | 622 | 1046 |
| E3 | 9481 | 94 | 127 | 298 |
| E4 | 3954 | 3080 | 5 | 2961 |
| E5 | 2886 | 1363 | 1320 | 4431 |
| E6 | 1500 | 2000 | 500 | 6000 |

## Property under Variable Permutation

|  | $\mathbf{A}$ | $\overline{\mathbf{A}}$ |
| :---: | :---: | :---: |
| $\mathbf{B}$ | p | r |
| $\overline{\mathbf{B}}$ | q | s |

## Does $M(A, B)=M(B, A)$ ?

Symmetric measures:

- support, lift, collective strength, cosine, Jaccard, etc

Asymmetric measures:

- confidence, conviction, Laplace, J-measure, etc

## Property under Row/Column Scaling

Grade-Gender Example (Mosteller, 1968):

|  | Male | Female |  |
| :---: | :---: | :---: | :---: |
| High | 2 | 3 | 5 |
| Low | 1 | 4 | 5 |
|  | 3 | 7 | 10 |

|  | Male | Female |  |
| :---: | :---: | :---: | :---: |
| High | 4 | 30 | 34 |
| Low | 2 | 40 | 42 |
|  | 6 | 70 | 76 |
|  | $\downarrow$ | $\downarrow$ |  |
|  | $2 x$ | $10 x$ |  |

Mosteller:
Underlying association should be independent of the relative number of male and female students in the samples

## Property under Inversion Operation

(a)

| C | D |
| :---: | :---: |
| 0 | 1 |
| 1 | 1 |
| 1 | 1 |
| 1 | 1 |
| 1 | 0 |
| 1 | 1 |
| 1 | 1 |
| 1 | 1 |
| 1 | 1 |
| 0 | 1 |

(b)

(c)

## Example: $\phi$-Coefficient

- $\phi$-coefficient is analogous to correlation coefficient for continuous variables

|  | $Y$ | $\bar{Y}$ |  |
| :---: | :---: | :---: | :---: |
| $\mathbf{X}$ | 60 | 10 | 70 |
| $\bar{X}$ | 10 | 20 | 30 |
|  | 70 | 30 | 100 |

|  | $Y$ | $\bar{Y}$ |  |
| :---: | :---: | :---: | :---: |
| $\mathbf{X}$ | 20 | 10 | 30 |
| $\mathbf{X}$ | 10 | 60 | 70 |
|  | 30 | 70 | 100 |

$\varphi=\frac{0.6-0.7 \times 0.7}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}}$

$$
\begin{aligned}
\varphi & =\frac{0.2-0.3 \times 0.3}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} \\
& =0.5238
\end{aligned}
$$

$\phi$ Coefficient is the same for both tables

## Property under Null Addition

|  | $\mathbf{B}$ | $\overline{\mathbf{B}}$ |
| :---: | :---: | :---: |
| $\mathbf{A}$ | p | q |
| $\overline{\mathbf{A}}$ | r | s |

|  | $\mathbf{B}$ | $\overline{\mathbf{B}}$ |
| :---: | :---: | :---: |
| $\mathbf{A}$ | p | q |
| $\overline{\mathbf{A}}$ | r | $\mathrm{s}+\mathrm{k}$ |

Invariant measures:

- support, cosine, Jaccard, etc

Non-invariant measures:
correlation, Gini, mutual information, odds ratio, etc

## Different Measures have Different Properties

| Symbol | Measure | Range | P1 | P2 | P3 | 01 | 02 | 03 | O3' |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ¢ | Correlation | -1 ... $0 \ldots 1$ | Yes | Yes | Yes | Yes | No | Yes | Yes |
| $\lambda$ | Lambda | $0 \ldots 1$ | Yes | No | No | Yes | No | No* | Yes |
| $\alpha$ | Odds ratio | $0 \ldots 1 \ldots \infty$ | Yes* | Yes | Yes | Yes | Yes | Yes* | Yes |
| Q | Yule's Q | -1 ... $0 \ldots 1$ | Yes | Yes | Yes | Yes | Yes | Yes | Yes |
| Y | Yule's Y | -1 ... $0 . . .1$ | Yes | Yes | Yes | Yes | Yes | Yes | Yes |
| $\kappa$ | Cohen's | -1 ... $0 . . .1$ | Yes | Yes | Yes | Yes | No | No | Yes |
| M | Mutual Information | $0 \ldots 1$ | Yes | Yes | Yes | Yes | No | No* | Yes |
| $J$ | $J$-Measure | $0 \ldots 1$ | Yes | No | No | No | No | No | No |
| G | Gini Index | $0 \ldots 1$ | Yes | No | No | No | No | No* | Yes |
| S | Support | $0 \ldots 1$ | No | Yes | No | Yes | No | No | No |
| C | Confidence | $0 . . .1$ | No | Yes | No | Yes | No | No | No |
| L | Laplace | $0 \ldots 1$ | No | Yes | No | Yes | No | No | No |
| V | Conviction | $0.5 \ldots 1 \ldots \infty$ | No | Yes | No | Yes** | No | No | Yes |
| 1 | Interest | $0 \ldots 1 \ldots \infty$ | Yes* | Yes | Yes | Yes | No | No | No |
| IS | IS (cosine) | 0 .. 1 | No | Yes | Yes | Yes | No | No | No |
| PS | Piatetsky-Shapiro's | $-0.25 \ldots 0 \ldots 0.25$ | Yes | Yes | Yes | Yes | No | Yes | Yes |
| F | Certainty factor | $-1 \ldots 0 \ldots 1$ | Yes | Yes | Yes | No | No | No | Yes |
| AV | Added value | $0.5 \ldots 1 \ldots 1$ | Yes | Yes | Yes | No | No | No | No |
| S | Collective strength | $0 \ldots 1 \ldots \infty$ | No | Yes | Yes | Yes | No | Yes* | Yes |
| $\zeta$ | Jaccard | $0 . .1$ | No | Yes | Yes | Yes | No | No | No |
| K | Klosgen's | $\left(\sqrt{\frac{2}{\sqrt{3}}-1}\right)\left(2-\sqrt{3}-\frac{1}{\sqrt{3}}\right) \ldots 0 \ldots \frac{2}{3 \sqrt{3}}$ | Yes | Yes | Yes | No | No | No | No |

## Support-based Pruning

- Most of the association rule mining algorithms use support measure to prune rules and itemsets
- Study effect of support pruning on correlation of itemsets
- Generate 10000 random contingency tables
- Compute support and pairwise correlation for each table
- Apply support-based pruning and examine the tables that are removed

## Effect of Support-based Pruning

All Itempairs

## Effect of Support-based Pruning

Support < 0.03

Support < 0.05

Comelation

## Effect of Support-based Pruning

- Investigate how support-based pruning affects other measures
- Steps:
- Generate 10000 contingency tables
- Rank each table according to the different measures
- Compute the pair-wise correlation between the measures

## Effect of Support-based Pruning

- Without Support Pruning (All Pairs)

APais(4019)

Scatter Plot between Correlation \& Jaccard Measure

- Red cells indicate correlation between the pair of measures > 0.85
- $40.14 \%$ pairs have correlation $>0.85$

## Effect of Support-based Pruning

- $0.5 \%$ s support $\leq 50 \%$

Scatter Plot between Correlation \& Jaccard Measure:

- 61.45\% pairs have correlation > 0.85

## Effect of Support-based Pruning

- $0.5 \%$ s support $\leq 30 \%$

-76.42\% pairs have correlation > 0.85

Scatter Plot between Correlation \& Jaccard Measure

## Subjective Interestingness Measure

- Objective measure:
- Rank patterns based on statistics computed from data
- e.g., 21 measures of association (support, confidence, Laplace, Gini, mutual information, Jaccard, etc).
- Subjective measure:
- Rank patterns according to user's interpretation
- A pattern is subjectively interesting if it contradicts the expectation of a user (Silberschatz \& Tuzhilin)
- A pattern is subjectively interesting if it is actionable (Silberschatz \& Tuzhilin)

## Interestingness via Unexpectedness

- Need to model expectation of users (domain knowledge)

+ Pattern expected to be frequent
- Pattern expected to be infrequent
$\square$ Pattern found to be frequent
Pattern found to be infrequent
+ Expected Patterns
$-\quad+$ Unexpected Patterns
- Need to combine expectation of users with evidence from data (i.e., extracted patterns)

## Interestingness via Unexpectedness

- Web Data (Cooley et al 2001)
- Domain knowledge in the form of site structure
- Given an itemset $F=\left\{X_{1}, X_{2}, \ldots, X_{k}\right\} \quad\left(X_{i}\right.$ : Web pages)
- L : number of links connecting the pages
- Ifactor $=\mathrm{L} /(\mathrm{k} \times \mathrm{k}-1)$
- cfactor $=1$ (if graph is connected), 0 (disconnected graph)
- Structure evidence $=$ cfactor $\times$ Ifactor
- Usage evidence $=\frac{P\left(X_{1} \cap X_{2} \cap \ldots \cap X_{k}\right)}{P\left(X_{1} \cup X_{2} \cup \ldots \cup X_{k}\right)}$
- Use Dempster-Shafer theory to combine domain knowledge and evidence from data
