they are called pre-terms, why?

$x + 1$ ✓

$\textbf{if } x \textbf{ then } x + 1 \textbf{ else } x - 1$ ✓

$(0, \lambda x.\ x)$ ✓

$\textbf{fst}(0, \lambda x.\ x)$ ✓

$(\lambda x.\ x + 1)\ 3$ ✓

$\textbf{rec } f.\ \lambda x.\ x + (f\ 0)$ ✓

we need a type system

✗ $1 + (0, 5)$

HOFL types

Types

$$
\begin{array}{rcl}
t & ::= & x \mid n \mid t_0 \text{ op } t_1 \mid \textbf{if } t \textbf{ then } t_0 \textbf{ else } t_1 \\
& \mid & (t_0, t_1) \mid \textbf{fst}(t) \mid \textbf{snd}(t) \\

& \mid & \textbf{rec } x.\ t
\end{array}
$$

which types? infinitely many combinations!

	pairs	functions
int	$int * int$	$int \to int$
	$int * (int \to int)$	$(int * int) \to int$
	$int * (int * int)$	$(int \to int) \to int$
$(int \to int) * (int \to int)$		$(int \to int) \to (int \to (int * int))$

Types Syntax

$$\tau \ ::= \ int \ \mid \ \tau_0 * \tau_1 \ \mid \ \tau_0 \to \tau_1$$

$\mathcal{T}$ set of all types

why not lists?

for the same reason we avoid division
head and tail are not total functions

assume variables are typed

$$Ide = \{Ide_\tau\}_{\tau \in \mathcal{T}}$$

$$\widehat{\cdot} : Ide \to \mathcal{T}$$

$\widehat{x}$ denotes the type of x

Type judgements

formulas: $t : \tau$ reads “has type”

types are assigned to pre-terms
using a set of inference rules
(structural induction of HOFL syntax)

Type system

$$\frac{}{x : \widehat{x}} \qquad \frac{}{n : int} \qquad \frac{t_0 : int \quad t_1 : int}{t_0 \text{ op } t_1 : int} \qquad \frac{t : int \quad t_0 : \tau \quad t_1 : \tau}{\textbf{if } t \textbf{ then } t_0 \textbf{ else } t_1 : \tau}$$

$$\frac{t_0 : \tau_0 \quad t_1 : \tau_1}{(t_0, t_1) : \tau_0 * \tau_1} \qquad \frac{t : \tau_0 * \tau_1}{\textbf{fst}(t) : \tau_0} \qquad \frac{t : \tau_0 * \tau_1}{\textbf{snd}(t) : \tau_1}$$

$$\frac{x : \tau_0 \quad t : \tau_1}{\lambda x.\ t : \tau_0 \to \tau_1} \qquad \frac{t_1 : \tau_0 \to \tau_1 \quad t_0 : \tau_0}{t_1\ t_0 : \tau_1}$$

$$\frac{x : \tau \quad t : \tau}{\textbf{rec } x.\ t : \tau}$$

Well-formed terms

$$t \quad ::= \quad x \mid n \mid t_0 \text{ op } t_1 \mid \textbf{if } t \textbf{ then } t_0 \textbf{ else } t_1 \mid (t_0, t_1) \mid \textbf{fst}(t) \mid \textbf{snd}(t) \mid \lambda x.\, t \mid t_0\ t_1 \mid \textbf{rec } x.\, t$$

$$\tau \quad ::= \quad int \mid \tau_0 * \tau_1 \mid \tau_0 \to \tau_1$$

$\mathcal{T}$ set of all types

a pre-term t is *well formed* if $\exists \tau \in \mathcal{T}.\ t : \tau$

i.e. if we can assign a type to it

also called *well-typed* or *typeable*

T_τ set of all well-formed terms of type τ

Type inference

Example

types of variables are not given
type rules are used to derive type constraints (type equations)
whose solutions (via unification) define the principal type

$$t \stackrel{\text{def}}{=} \mathbf{rec}\ p.\ \lambda x.\ (x, (p\ (x+2)))$$

intuitively

$$t\ 0 \equiv (0, (t\ 2)) \equiv (0, (2, (t\ 4))) \equiv \cdots \equiv (0, (2, (4, \ldots)))$$

sequence of all even numbers

we can type sequence of integers of fixed length
we have no type for sequences of any/infinite length

Example

types of variables are not given
type rules are used to derive type constraints (type equations)
whose solutions (via unification) define the principal type

$$t \stackrel{\text{def}}{=} \mathbf{rec}\ p.\ \lambda x.\ (x, (p\ (x+2)))$$

Haskell

```
Prelude> let p x = (x, p (x+2))

<interactive>:…:5: error:
    • Occurs check: cannot construct the infinite type: b ~ (t, b)
      Expected type: t -> b
        Actual type: t -> (t, b)
    • Relevant bindings include

$$t \stackrel{\text{def}}{=} \mathbf{rec}\ p.\ \lambda x.\ (x, (p\ (x+2)))$$

more concisely

$$t = \mathbf{rec}\ \underbrace{p}_{int \to \tau_4}.\quad \lambda\ \underbrace{x}_{int}\ .\ (\underbrace{x}_{int}, (\quad \underbrace{p}_{int \to \tau_4}\quad (\underbrace{\underbrace{x}_{int} + \underbrace{2}_{int}}_{int})))_{\tau_4}$$

Example

$$t \stackrel{\text{def}}{=} \mathbf{rec}\ p.\ \lambda x.\ (x, (p\ (x+2)))$$

more concisely

$$t = \mathbf{rec}\ \underset{int\to\tau_4}{p}.\quad \lambda\ \underset{int}{x}\ .\ (\underset{int}{x}, (\quad \underset{int\to\tau_4}{p}\quad (\underbrace{\underset{int}{x} + \underset{int}{2}}_{int})))}_{\tau_4}}_{int*\tau_4}$$

Example

$$t \stackrel{\text{def}}{=} \mathbf{rec}\ p.\ \lambda x.\ (x,(p\ (x+2)))$$

more concisely

$$t = \mathbf{rec}\ \underset{int\to\tau_4}{p}.\quad \lambda\ \underset{int}{x}\ .\ (\underset{int}{x},(\ \underset{int\to\tau_4}{p}\quad (\underset{int}{x}+\underset{int}{2})))$$

$$int \qquad int \qquad int \qquad int \qquad int$$

$$int$$

$$\tau_4$$

$$int*\tau_4$$

$$(int\to(int*\tau_4)) = (int\to\tau_4) \Rightarrow \tau_4=(int*\tau_4)$$
