# Statistics for Data Science

## Lesson 11 - Moments. Functions of random variables

Salvatore Ruggieri

Department of Computer Science
University of Pisa, Italy
salvatore.ruggieri@unipi.it

# Moments

- Let $X$ be a continuous random variable with density function $f(x)$
- $k^{th}$ *moment* of $X$, if it exists, is:

$$E[X^k] = \int_{-\infty}^{\infty} x^k f(x)dx$$

- $\mu = E[X]$ is the first moment of $X$
- $k^{th}$ *central moment* of $X$ is:

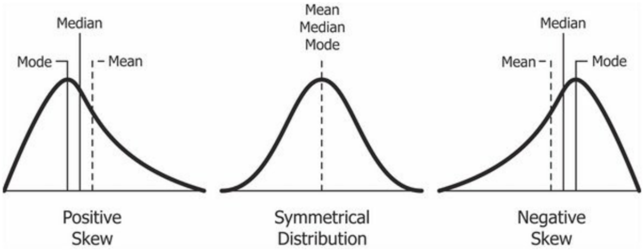
$$\mu_k = E[(X-\mu)^k] = \int_{-\infty}^{\infty} (x-\mu)^k f(x)dx$$

- $\sigma = \sqrt{E[(X-\mu)^2]}$ standard deviation is the square root of the second central moment
- $k^{th}$ *standardized moment* of $X$ is:

$$\tilde{\mu}_k = \frac{\mu_k}{\sigma^k} = E\left[(\frac{X-\mu}{\sigma})^k\right]$$

# Skewness

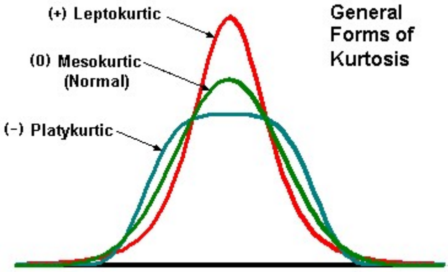
- $\tilde{\mu}_1 = {}^{E[(X-\mu)]}/_{\sigma} = 0$ since $E[X - \mu] = 0$
- $\tilde{\mu}_2 = {}^{E[(X-\mu)^2]}/_{\sigma^2} = 1$ since $\sigma^2 = E[(X - \mu)^2]$
- $\tilde{\mu}_3 = {}^{E[(X-\mu)^3]}/_{\sigma^3}$ *[(Pearson's moment) coefficient of skewness]*
- Skewness indicates direction and magnitude of a distribution's deviation from symmetry



- E.g., for $X \sim Exp(\lambda)$, $\tilde{\mu}_3 = 2$ **Prove it!**

# Kurtosis

- $\tilde{\mu}_4 = E[(\frac{X-\mu}{\sigma})^4]$ *[(Pearson's moment) coefficient of kurtosis]*
- For $X \sim N(\mu, \sigma)$, $\tilde{\mu}_4 = 3$ $\tilde{\mu}_4 - 3$ *is called kurtosis in excess*
- Kurtosis is a measure of the dispersion of $X$ around the two values $\mu \pm \sigma$



- $\tilde{\mu}_4 > 3$ *Leptokurtic* (slender) distribution has *fatter* tails. May have outlier problems.
- $\tilde{\mu}_4 < 3$ *Platykurtic* (broad) distribution has *thinner* tails

**See R script**

# Functions of random variables: expectation

- $V = \pi HR^2$ be the volume of a vase of height $H$ and radius $R$
- $g(H, R) = \pi HR^2$ is a random variable (function of random variables)
- $P_V(V = 3) = P_{HR}(\pi HR^2 = 3)$
- How to calculate $E[V]$ for $H \perp\!\!\!\perp R$?

$$E[V] = E[\pi HR^2] = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} \pi hr^2 f_H(h) f_R(r) dhdr$$

TWO-DIMENSIONAL CHANGE-OF-VARIABLE FORMULA. Let $X$ and $Y$ be random variables, and let $g : \mathbb{R}^2 \to \mathbb{R}$ be a function.
If $X$ and $Y$ are *discrete* random variables with values $a_1, a_2, \ldots$ and $b_1, b_2, \ldots$, respectively, then

$$\mathrm{E}\left[g(X, Y)\right] = \sum_i \sum_j g(a_i, b_j) \mathrm{P}(X = a_i, Y = b_j)\,.$$

If $X$ and $Y$ are *continuous* random variables with joint probability density function $f$, then

$$\mathrm{E}\left[g(X, Y)\right] = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} g(x, y) f(x, y)\,\mathrm{d}x\,\mathrm{d}y.$$

# Linearity of expectations

**Theorem.** For $X$ and $Y$ random variables, and $s, t \in \mathbb{R}$:

$$E[rX + sY + t] = rE[X] + sE[Y] + t$$

**Proof.** (discrete case)

$$E[rX + Ys + t] = \sum_a \sum_b (ra + sb + t)P(X = a, Y = b)$$

$$= \left(r \sum_a \sum_b aP(X = a, Y = b)\right) + \left(s \sum_a \sum_b bP(X = a, Y = b)\right) + \left(t \sum_a \sum_b P(X = a, Y = b)\right)$$

$$= \left(r \sum_a aP(X = a)\right) + \left(s \sum_b bP(Y = b)\right) + t = rE[X] + sE[Y] + t$$

**Corollary.** $E[a_0 + \sum_{i=1}^n a_i X_i] = a_o + \sum_{i=1}^n a_i E[X_i]$

**Corollary.** $X \leq Y$ implies $E[X] \leq E[Y]$
**Proof.** $Z = Y - X \geq 0$ implies $E[Z] = E[Y] - E[X] \geq 0$, i.e., $E[Y] \geq E[X]$.

# Applications

- Expectation of some discrete distributions
  - $X \sim Ber(p) \quad E[X] = p$
  - $X \sim Bin(n, p) \quad E[X] = n \cdot p$
    - Because $X = \sum_{i=1}^{n} X_i$ for $X_1, \ldots, X_n \sim Ber(p)$
  - $X \sim Geo(p) \quad E[X] = \frac{1}{p}$
  - $X \sim NBin(n, p) \quad E[X] = \frac{n \cdot (1-p)}{p}$
    - Because $X = \sum_{i=1}^{n} X_i - n$ for $X_1, \ldots, X_n \sim Geo(p)$
- Expectation of some continuous distributions
  - $X \sim Exp(\lambda) \quad E[X] = {}^{1}/_{\lambda}$
  - $X \sim Erl(n, \lambda) \quad E[X] = \frac{n}{\lambda}$
    - Because $X = \sum_{i=1}^{n} X_i$ for $X_1, \ldots, X_n \sim Exp(\lambda)$

# Expectation of product and quotients

**Theorem.** For $X \perp\!\!\!\perp Y$, we have: $E[XY] = E[X]E[Y]$ **Prove it!**

PROPAGATION OF INDEPENDENCE. Let $X_1, X_2, \ldots, X_n$ be independent random variables. For each $i$, let $h_i : \mathbb{R} \to \mathbb{R}$ be a function and define the random variable

$$Y_i = h_i(X_i).$$

Then $Y_1, Y_2, \ldots, Y_n$ are also independent.

**Corollary.** For $X \perp\!\!\!\perp Y$ and $Y \geq 0$, we have: $E[X/Y] \geq E[X]/E[Y]$
*Proof.* $X \perp\!\!\!\perp Y$ implies $X \perp\!\!\!\perp {}^1/_Y$. By theorem above:

$$E[X/Y] = E[X \cdot {}^1/_Y] = E[X]E[{}^1/_Y]$$

and then by Jensen's inequality $E[X/Y] \geq E[X]/E[Y]$ since $1/y$ is convex for $y \geq 0$. $\square$

**Exercise at home.** Show that $E[X/Y] = E[X]/E[Y]$ is a false claim.

# Law of iterated expectations

**Conditional expectation**

$$E[X|Y=b] = \sum_i a_i p_{X|Y}(a_i|b) \qquad E[X|Y=y] = \int_{-\infty}^{\infty} x f_{X|Y}(x|y)dx$$

- **Def.** $E_Y[E[X|Y]] = \sum_j E[X|Y=b_j]p_Y(b_j)$ and $E_Y[E[X|Y]] = \int_{-\infty}^{\infty} E[X|Y=y]f_Y(y)dy$
- **Theorem.** (Law of iterated expectations)

$$E_Y[E[X|Y]] = E[X]$$

**Proof.** ($X, Y$ discrete random variables)

$$E_Y[E[X|Y]] = \sum_j \sum_i a_i p_{X|Y}(a_i|b_j)p_Y(b_j) = \sum_j \sum_i a_i p_{XY}(a_i, b_j) = \sum_i a_i p_X(a_i) = E[X]$$

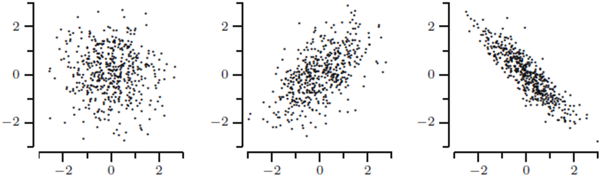
# Variance of the sum and Covariance

$$
\begin{aligned}
Var(X+Y) &= E[(X+Y-E[X+Y])^2] = E[((X-E[X])+(Y-E[Y]))^2] \\
&= E[(X-E[X])^2] + E[(Y-E[Y])^2] + 2E[(X-E[X])(Y-E[Y])] \\
&= Var(X) + Var(Y) + 2Cov(X,Y)
\end{aligned}
$$

## Covariance

The *covariance* $Cov(X,Y)$ of two random variables $X$ and $Y$ is the number:

$$Cov(X,Y) = E[(X-E[X])(Y-E[Y])]$$



**Uncorrelated** **Positively correlated** **Negatively correlated**

# Covariance

**Theorem.** $Cov(X, Y) = E[XY] - E[X]E[Y]$ **Prove it!**

- If $X$ and $Y$ are independent, $Cov(X, Y) = 0$ and $Var(X + Y) = Var(X) + Var(Y)$
- But there are $X$ and $Y$ uncorrelated (ie., $Cov(X, Y) = 0$) that are dependent!
- Variances of some discrete distributions
  - $X \sim Ber(p)$ $Var(X) = p(1 - p)$
  - $X \sim Bin(n, p)$ $Var(X) = np(1 - p)$
    - Because $X = \sum_{i=1}^{n} X_i$ for $X_1, \ldots, X_n \sim Ber(p)$ and independent
  - $X \sim Geo(p)$ $Var(X) = \frac{1-p}{p^2}$
  - $X \sim NBin(n, p)$ $Var(X) = n\frac{1-p}{p^2}$
    - Because $X = \sum_{i=1}^{n} X_i - n$ for $X_1, \ldots, X_n \sim Geo(p)$ and independent
- Variances of some continuous distributions
  - $X \sim Exp(\lambda)$ $Var(X) = {}^{1}/_{\lambda^2}$
  - $X \sim Erl(n, \lambda)$ $Var(X) = \frac{n}{\lambda^2}$
    - Because $X = \sum_{i=1}^{n} X_i$ for $X_1, \ldots, X_n \sim Exp(\lambda)$ and independent

# Covariance

COVARIANCE UNDER CHANGE OF UNITS. Let $X$ and $Y$ be two random variables. Then

$$\operatorname{Cov}(rX + s, tY + u) = rt \operatorname{Cov}(X, Y)$$

for all numbers $r, s, t$, and $u$.

- Hence, $Var(rX + sY + t) = r^2 Var(X) + s^2 Var(Y) + 2rsCov(X, Y)$
- Covariance depends on the units of measure!

# Correlation coefficient

DEFINITION. Let $X$ and $Y$ be two random variables. The *correlation coefficient* $\rho(X,Y)$ is defined to be 0 if $\mathrm{Var}(X)=0$ or $\mathrm{Var}(Y)=0$, and otherwise

$$\rho(X,Y)=\frac{\mathrm{Cov}(X,Y)}{\sqrt{\mathrm{Var}(X)\,\mathrm{Var}(Y)}}.$$

- Correlation coefficient is *dimensionless* (not affected by change of units)
  - E.g., if $X$ and $Y$ are in Km, then $Cov(X,Y)$, $Var(X)$ and $Var(Y)$ are in Km$^2$

$$-1 \leq \rho(X,Y) \leq 1$$

- The bounds are derived from the **Schwarz's inequality**:

$$E[|XY|] \leq \sqrt{E[X^2]}\sqrt{E[Y^2]}$$

**Proof.** For any $u, w \in \mathbb{R}$, we have $2|uw| \leq u^2 + w^2$. Therefore, $2|UW| \leq U^2 + W^2$ for r.v.'s $U$ and $V$. By defining $U = X/\sqrt{E[X^2]}$ and $W = Y/\sqrt{E[Y^2]}$ (*), we have $2XY/\sqrt{E[X^2]}\sqrt{E[Y^2]} \leq X^2/E[X^2] + Y^2/E[Y^2]$. Taking the expectations, we conclude: $2E[XY]/\sqrt{E[X^2]}\sqrt{E[Y^2]} \leq 2$. (*) The case $E[X^2]=0$ or $E[Y^2]=0$ is left as an exercise. $\square$

# Kullback-Leibler divergence

## KL divergence

For $X, Y$ discrete random variables with p.m.f. $p_X$ and $p_Y$:

$$D(X \parallel Y) = \sum_a p_X(a) \log \frac{p_X(a)}{p_Y(a)} = H(X, Y) - H(X)$$

where $H(X) = -\sum_a p_X(a) \log p_X(a)$ and $H(X; Y) = -\sum_a p_X(a) \log p_Y(a)$

- Measure how distribution of $Y$ (model) can reconstruct the distribution of $X$ (data)
  - Also called: relative entropy or information gain of $X$ w.r.t. $Y$
  - $H(X)$ is the entropy of $X$, and $H(X, Y)$ is the **cross entropy** of $X$ w.r..t $Y$
  - $H(X; Y)$ is the "information" or "uncertainty" or "loss" when using $Y$ to encode $X$
- Properties
  - $D(X \parallel Y) = 0$ iff $P(X \neq Y) = 0$, $\quad D(X \parallel Y) \neq D(Y \parallel X)$, and
  - $D(X \parallel Y) \geq 0$ **[Gibbs' inequality]**
- For $X, Y$ continuous: $D(X \parallel Y) = \int_{-\infty}^{\infty} f_X(x) \log \frac{f_X(x)}{f_Y(x)} dx$ **See R script**

# Mutual information

## Mutual information

For $X, Y$ discrete random variables with p.m.f. $p_X$ and $p_Y$ and joint p.m.f. $p_{XY}$:

$$I(X,Y) = D(p_{XY} \parallel p_X p_Y) = \sum_{a,b} p_{XY}(a,b) \log \frac{p_{XY}(a,b)}{p_X(a)p_Y(b)} = H(X) + H(Y) - H((X,Y))$$

where $H(X) = -\sum_a p_X(a) \log p_X(a)$ and $H((X,Y)) = -\sum_{a,b} p_{XY}(a,b) \log p_{XY}(a,b)$

- MI measures how dependent two distributions are
  - Measure how product of marginals can reconstruct the distribution joint distribution
- Properties
  - $I(X,Y) = I(Y,X)$, and $I(X,Y) \geq 0$
  - $I(X,Y) = 0$ iff $X \perp\!\!\!\perp Y$
  - $NMI = \frac{I(X,Y)}{\min\{H(X),H(Y)\}} \in [0,1]$ *[Normalized mutual information]*
- For $X, Y$ continuous: $I(X,Y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{XY}(x,y) \log \frac{f_{XY}(x,y)}{f_X(x) f_Y(y)} dxdy$ **See R script**

# Sum of independent random variables

- For $X \sim F_X$ and $Y \sim F_Y$, let $Z = X + Y$. We know

$$E[Z] = E[X] + E[Y] \qquad Var(Z) = Var(X) + Var(Y) + 2Cov(X, Y)$$

- What is the distribution function of $Z$ when $X \perp\!\!\!\perp Y$?
- Examples:
  - For $X \sim Bin(n, p)$ and $Y \sim Bin(m, p)$, $Z \sim Bin(n + m, p)$
  - For $X \sim Geo(p)$ (days radio 1 breaks) and $Y \sim Geo(p)$ (days radio 2 breaks):

$$p_Z(X + Y = k) = \sum_{l=1}^{k-1} p_X(l) \cdot p_Y(k - l) = (k - 1)p^2(1 - p)^{k-2}$$

- See Lesson 04 and Lesson 08 for convolution formulas

ADDING TWO INDEPENDENT DISCRETE RANDOM VARIABLES. Let $X$ and $Y$ be two independent discrete random variables, with probability mass functions $p_X$ and $p_Y$. Then the probability mass function $p_Z$ of $Z = X + Y$ satisfies

$$p_Z(c) = \sum_j p_X(c - b_j) p_Y(b_j),$$

# Sum of two Normal random variables

**Theorem.** If $X \sim N(\mu_X, \sigma_X^2)$ and $Y \sim N(\mu_Y, \sigma_Y^2)$ and $X \perp\!\!\!\perp Y$, then:

$$Z = X + Y \sim N(\mu_X + \mu_Y, \sigma_X^2 + \sigma_Y^2)$$

**Proof.** See [T, Sect. 11.2] $\square$

- In general: $Z = aX + bY + c \sim N(a\mu_X + b\mu_Y + c, a^2\sigma_X^2 + b^2\sigma_Y^2)$
- The converse of the theorem also holds: *[**Lévy-Cramér theorem**]*
  - If $X \perp\!\!\!\perp Y$ and $Z = X + Y$ is normally distributed, then $X$ and $Y$ follow a normal distribution.

# Extremes of independent random variables

THE DISTRIBUTION OF THE MAXIMUM. Let $X_1, X_2, \ldots, X_n$ be $n$ independent random variables with the same distribution function $F$, and let $Z = \max\{X_1, X_2, \ldots, X_n\}$. Then

$$F_Z(a) = (F(a))^n.$$

- $P(Z \leq a) = P(X_1 \leq a, \ldots, X_n \leq a) = \prod_{i=1}^{n} P(X_i \leq a) = ((F(a))^n$
- Example: maximum water level over 365 days

THE DISTRIBUTION OF THE MINIMUM. Let $X_1, X_2, \ldots, X_n$ be $n$ independent random variables with the same distribution function $F$, and let $V = \min\{X_1, X_2, \ldots, X_n\}$. Then

$$F_V(a) = 1 - (1 - F(a))^n.$$

- $P(V \leq a) = 1 - P(X_1 > a, \ldots, X_n > a) = 1 - \prod_{i=1}^{n}(1 - P(X_i \leq a) = 1 - ((1 - F(a))^n$

# Product and quotient of independent random variables

PRODUCT OF INDEPENDENT CONTINUOUS RANDOM VARIABLES. Let $X$ and $Y$ be two independent continuous random variables with probability densities $f_X$ and $f_Y$. Then the probability density function $f_Z$ of $Z = XY$ is given by

$$f_Z(z) = \int_{-\infty}^{\infty} f_Y\left(\frac{z}{x}\right) f_X(x) \frac{1}{|x|} \, \mathrm{d}x$$

for $-\infty < z < \infty$.

QUOTIENT OF INDEPENDENT CONTINUOUS RANDOM VARIABLES. Let $X$ and $Y$ be two independent continuous random variables with probability densities $f_X$ and $f_Y$. Then the probability density function $f_Z$ of $Z = X/Y$ is given by

$$f_Z(z) = \int_{-\infty}^{\infty} f_X(zx) f_Y(x) |x| \, \mathrm{d}x$$

for $-\infty < z < \infty$.

- $X, Y \sim N(0,1)$ independent, $Z = X/Y \sim Cau(0,1)$ where:

$$f_Z(x) = \frac{1}{\pi(1+x^2)}$$
