Sommario della lezione

- Principi di base della visione retinica
- Alcune proprietà delle immagini retiniche
- Le relazioni matematiche tra immagini retiniche e cartesiane
- La foveazione
- Una testa robotica antropomorfa
- Esempi di applicazione in robotica

Riferimenti bibliografici:

The Retina-like Giotto cameras

- Technology: 0.35 micrometer CMOS
- Total Pixels: 33193
- Geometry:
 - 110 rings with 252 pixels
 - 42 rings with a number of pixels decreasing toward the center with a "sunflower" arrangement
- Tessellation: pseudo-triangular
- Pixels: direct read-out with logarithmic response
- Size of photosensitive area: 7.1mm diameter
- Constant resolution equivalent: 1090x1090
- On-chip processing: addressing, A/D, output amplifier

Le relazioni matematiche

From standard image to log-polar image

$$\rho(x, y) = \begin{cases} (F-1) + \log_{\lambda} \left[\left(F - \frac{1}{2} - \sqrt{x^2 + y^2} \right) (1 - \lambda) + \lambda \right] & \text{if } \sqrt{x^2 + y^2} > (F - \frac{1}{2}) \\ \left(\sqrt{x^2 + y^2} + \frac{1}{2} \right) & \text{if } \sqrt{x^2 + y^2} < (F - \frac{1}{2}) \end{cases}$$

$$r(\rho) = \left[\left(F - \frac{1}{2} \right) + \lambda \frac{1 - \lambda^{\rho-F}}{1 - \lambda} \right] \text{ if } \rho > F$$

$$\theta(x, y) = \frac{\Theta}{2\pi} \cdot \arctan\left(\frac{y}{x}\right) + \frac{\Theta}{2} + \text{Shift Factor}$$

$$F=42$$

$$P=152$$

$$\Theta=252$$

$$X=545$$

$$Y=545$$

$$\lambda=1.02314422608633$$

F = size of the fovea in rings.

P = total number of rings.

Θ = maximum # of pixels in each ring.

$2X$ = horizontal size of the cartesian image.

$2Y$ = vertical size of the cartesian image.

ρ = ring number in the log polar image.

θ = angular polar coordinate.

Retina-like vision for visuo-motor co-ordination of a robot head

Example of design and development of a human-like robotic head

The ARTS humanoid robot
head

Synthesis of characteristics of the human oculo-motor system

- Eye movements:
 - Saccades
 - Vergence
 - Pursuit
- Ranges of motion:
 - 120° for the tilt eye movements
 - 60° for the pan eye movements
- Eye speed:
 - Up to 900°/sec (in saccades)
- Inter-ocular distance:
between 60 and 80 mm

	Average	SD
Ventral flexion	60°	12
Dorsal flexion	61°	27
Right-left flexion	41°	7
Right-left rotation	79°	14

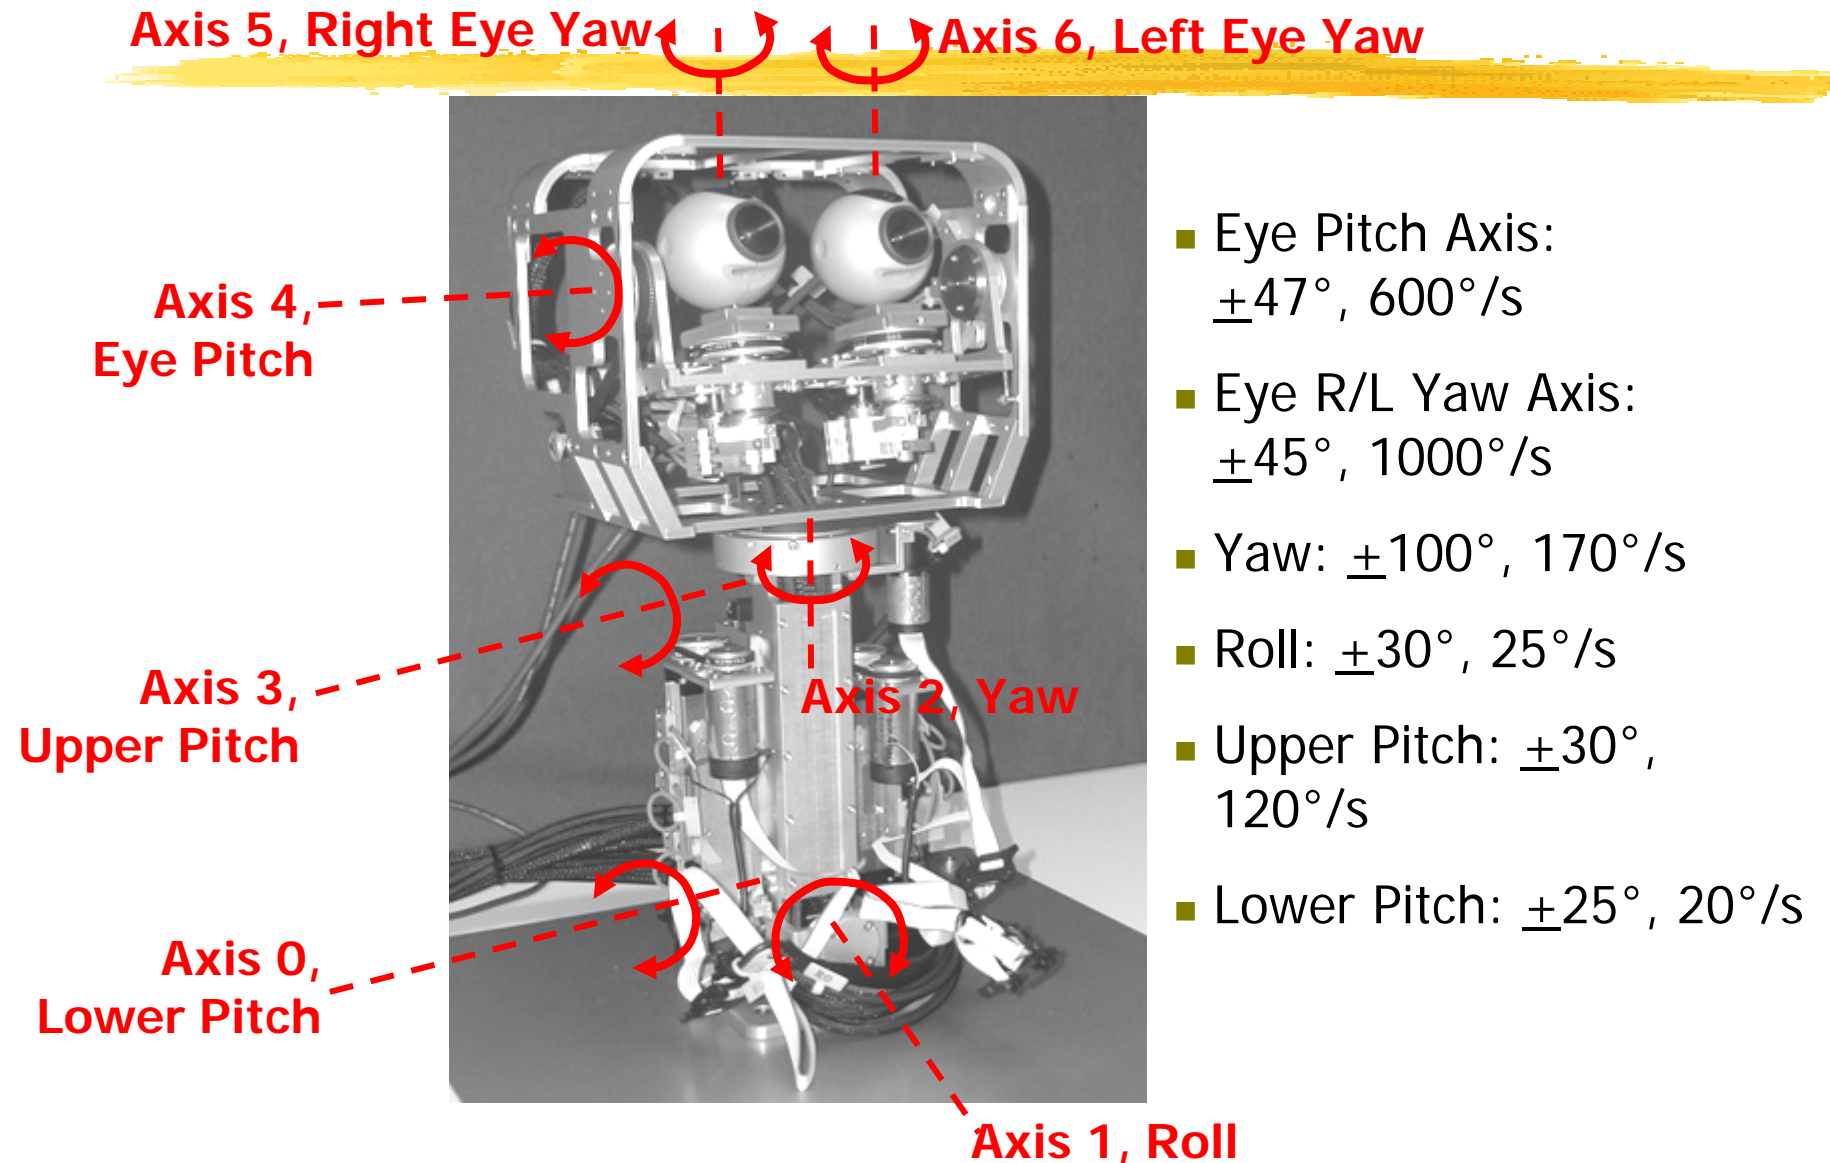

RANGE OF MOVEMENT AT THE NECK JOINT*

Preliminary activities

Foveation and tracking of borders of object and reconstruction of the geometry of the object

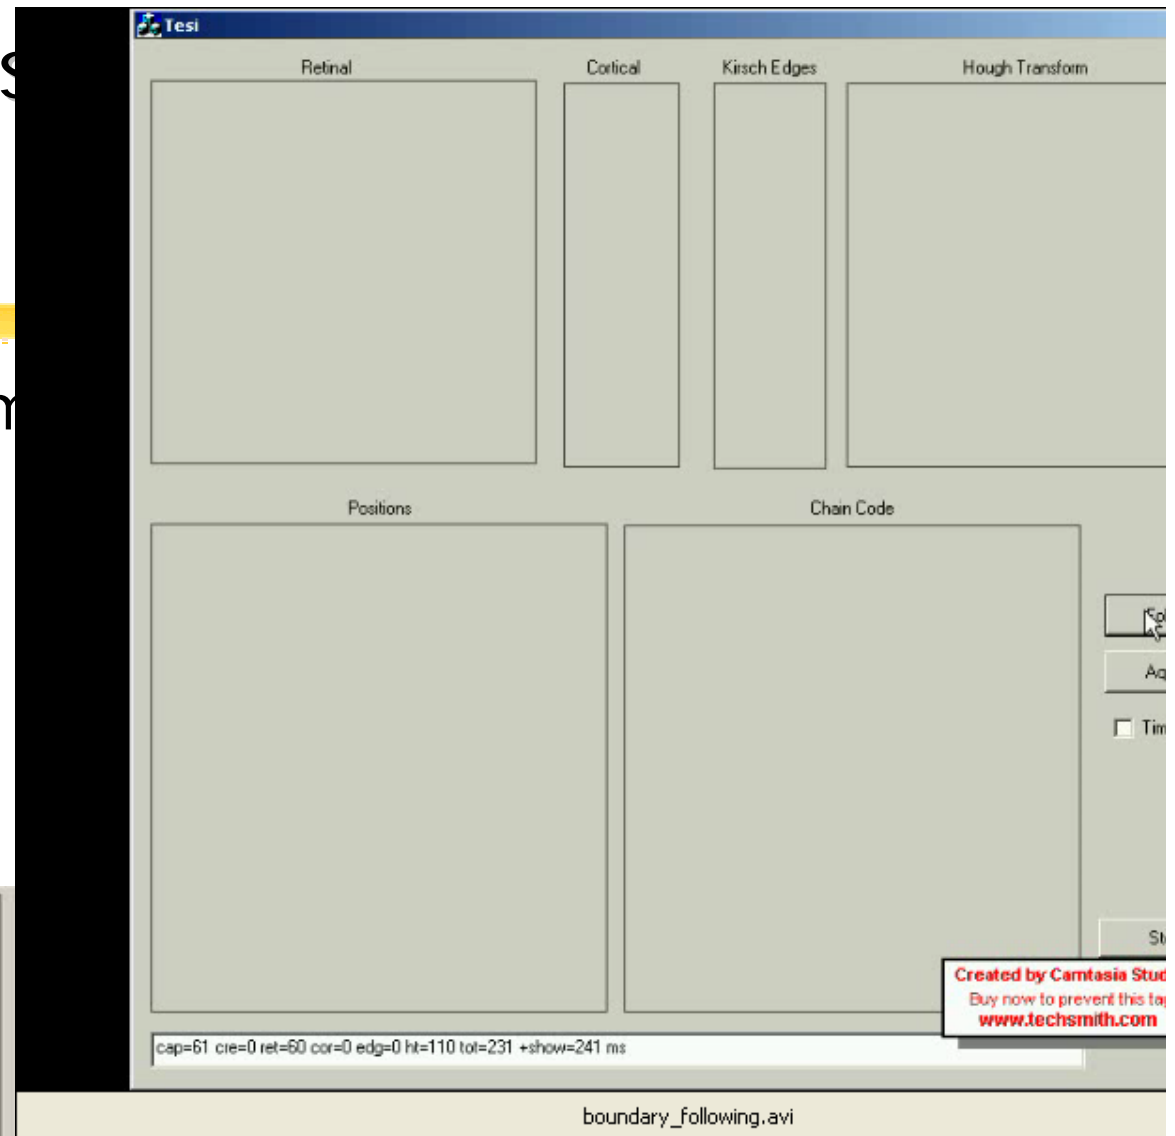

Retina Like image

Log Polar Image

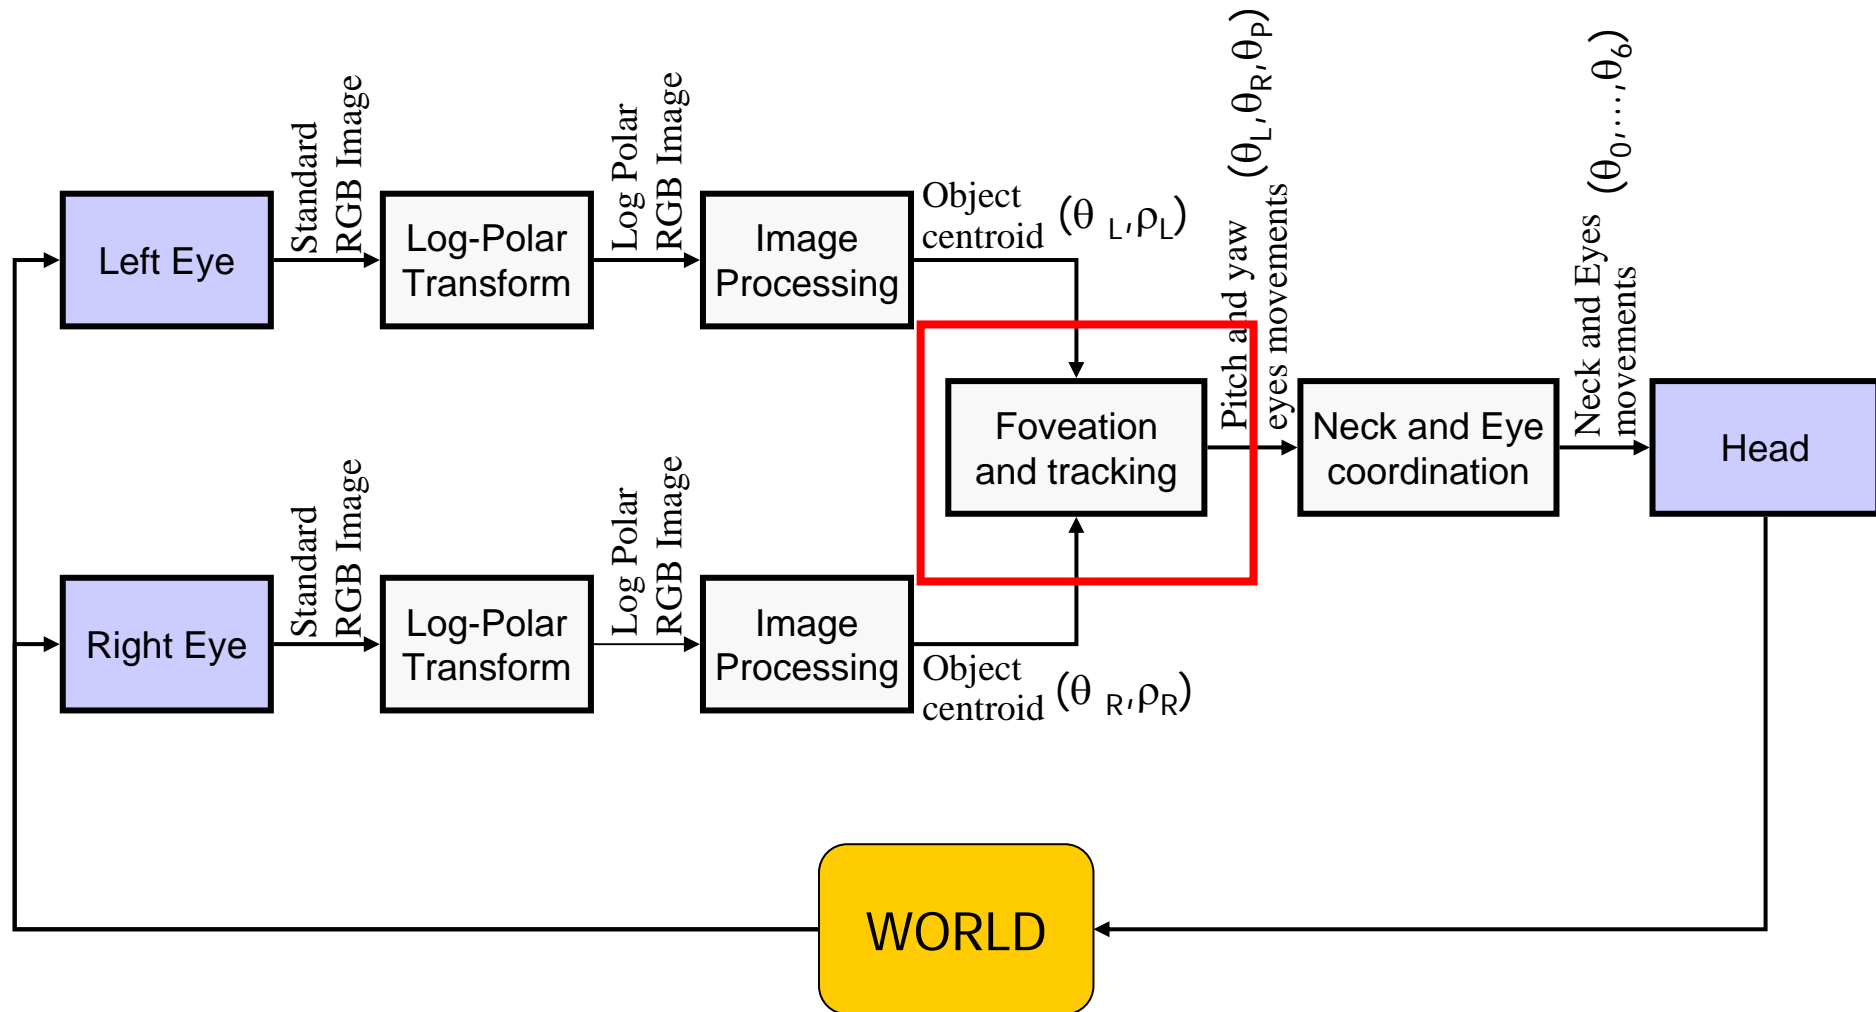

Edge of log polar image

Detected lines (Boundaries)

Boundary reconstruction based on eye positions

Overall sensory-motor scheme of the visual apparatus

Foveation of the object centroid

Proportional control based on the visual error

Left Image

$$O_L = (\rho_L, \theta_L)$$

$$e_L = \rho_L / M_{ro}$$

Right Image

$$O_R = (\rho_R, \theta_R)$$

$$e_R = \rho_R / M_{ro}$$

M_{ro} is the maximum ρ value (i.e. 152)

Computation of yaw and pitch eye movements

$$EY_L = e_L * \cos(\theta_L) * P_L$$

$$EP_L = e_L * \sin(\theta_L) * P_L$$

$$EY_R = e_R * \cos(\theta_R) * P_R$$

$$EP_R = e_R * \sin(\theta_R) * P_R$$

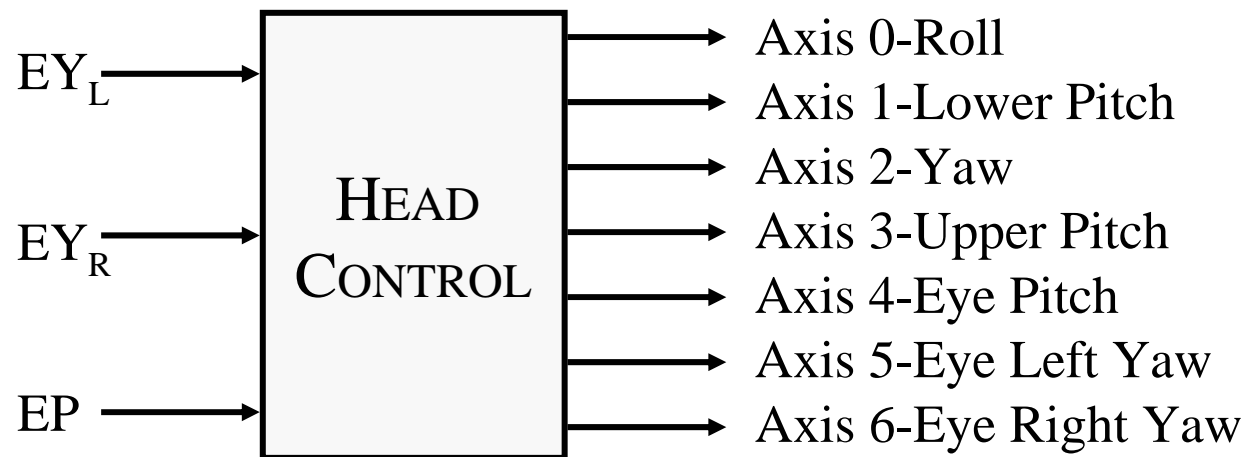

$$EP = (EP_L + EP_R) / 2$$

P_L and P_R are the proportional parameters for left and right eye, respectively.

Overall sensory-motor scheme of the visual apparatus

Eye-neck coordination

Solution 1

Distribution of the
movements between the
neck and eye DOF

1. *What is the purpose of this study?*
 2. *What are the research objectives?*
 3. *What is the research methodology?*
 4. *What are the findings of the study?*
 5. *What are the conclusions of the study?*
 6. *What are the implications of the study?*
 7. *What are the limitations of the study?*
 8. *What are the future research directions?*
 9. *What are the contributions of the study?*
 10. *What are the key words of the study?*

$$\begin{aligned} \text{EYL}_A + \text{EY}_L &< \text{T}_Y \\ \text{and} \\ \text{EYR}_A + \text{EY}_R &< \text{T}_Y \end{aligned}$$

Only eyes

$$\text{EYL}_D = \text{EYL}_A + \text{EYL}_L$$

$$\text{EYR}_D = \text{EYR}_A + \text{EY}_R$$

$$\text{YAW}_D = \text{YAW}_A$$

Strategy for the coordination of neck and eye movement (yaw)

- If the movement is larger, it is distributed among the eyes and the neck joints

$$EYL_A + EY_L > T_Y$$

or

$$EYR_A + EY_R > T_Y$$

Eyes and neck

$$\theta = \text{atan}((\tan(EY_L) + \tan(EY_R))/2)$$

$$EYL_D = EYL_A + EY_L - \theta$$

$$EYR_D = EYR_A + EY_R - \theta$$

$$YAW_D = YAW_A + \theta$$

Strategy for the coordination of neck and eye movement (yaw)

In particular the neck yaw angle is calculated as follows:

$$\theta(Y) = \arctan\left(\frac{tg\theta_R + tg\theta_L}{2}\right)$$

The upper and lower pitch of the head were instead calculated as a percentage of the eye pitch.

These proportions were extrapolated from experimental measurements on human beings.

Strategy for the coordination of neck and eye movement (pitch)

Eye, upper and lower pitch of the head are calculated as a percentage (proportional to the available range) of EP.

$$K1 = EP * EYP_{AV} / P_{AV}$$

$$K2 = EP * UP_{AV} / P_{av}$$

$$K3 = EP * LP_{AV} / P_{av}$$

$$EYP_D = EYP_A + EP * K1$$

$$EUP_D = EUP_A + EP * K2$$

$$ELP_D = ELP_A + EP * K3$$

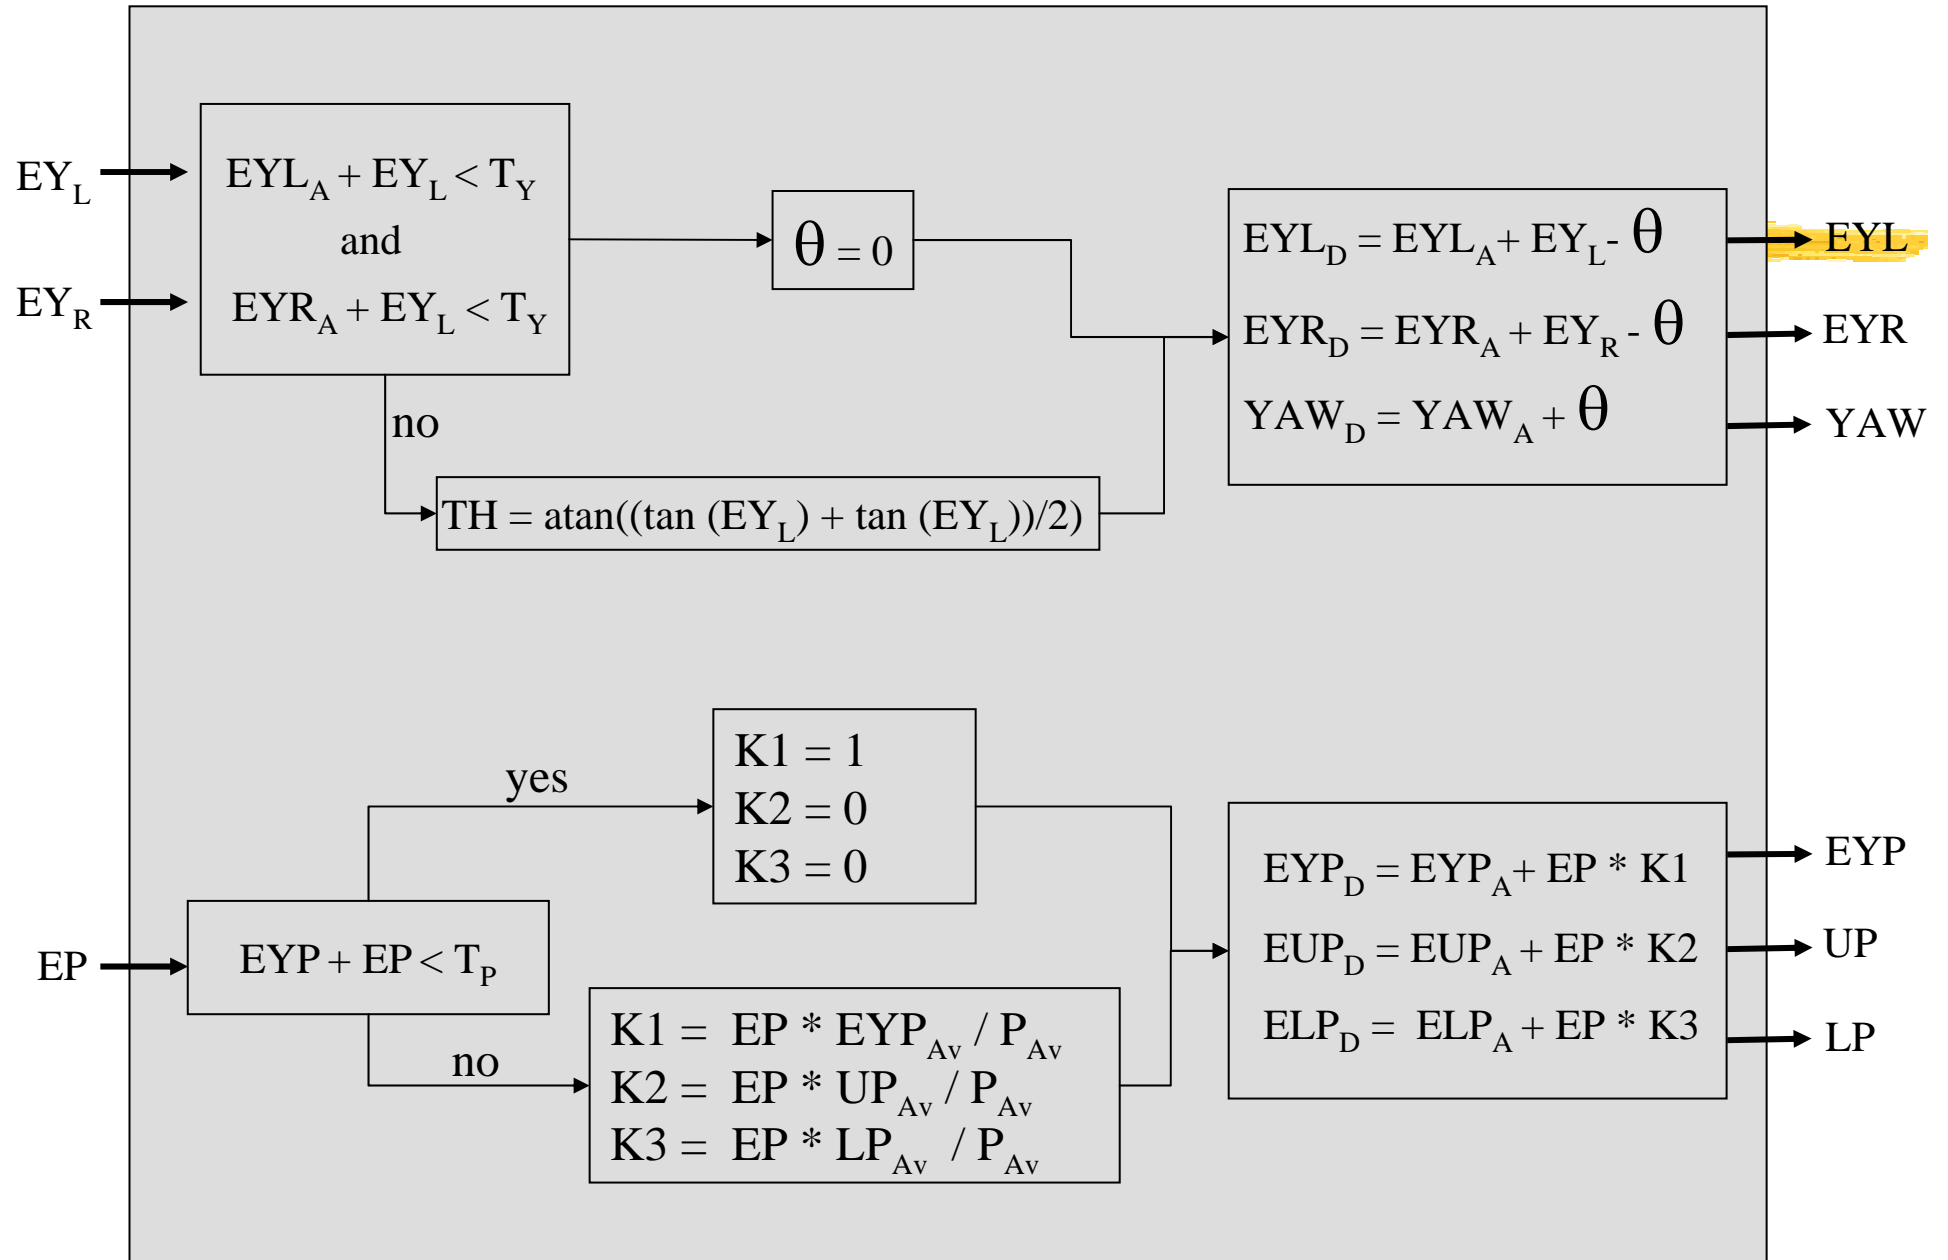

$$EYP_{AV} = EYP_M - EYP_A$$

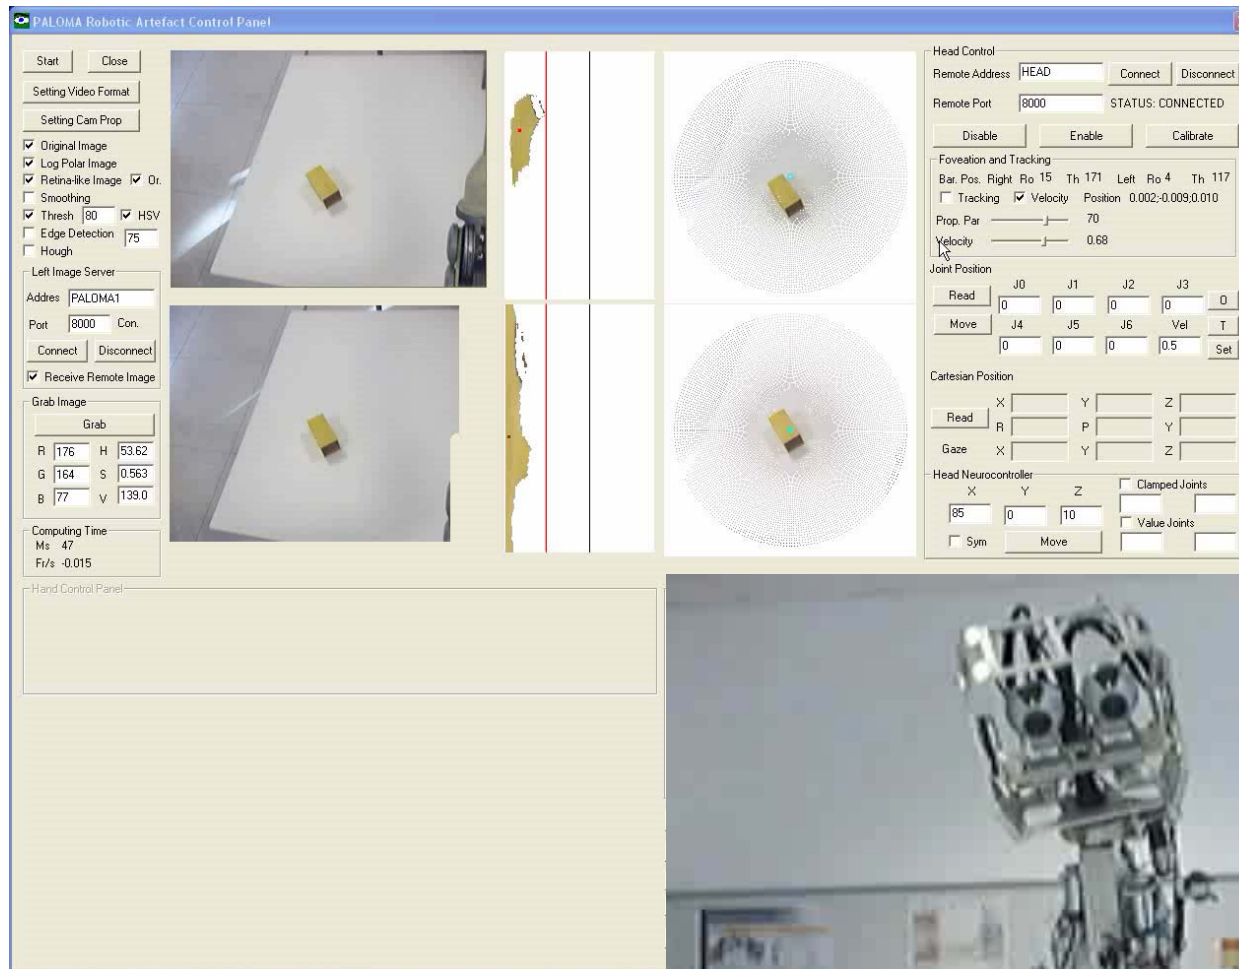

$$UP_{AV} = UP_M - UP_A$$

$$LP_{AV} = LP_M - UP_A$$

$$P_{AV} = EYP_{AV} + UP_{AV} + LP_{AV}$$

EYP_M , UP_M and LP_M are the range limits respectively for eye pitch, upper pitch and lower pitch axis

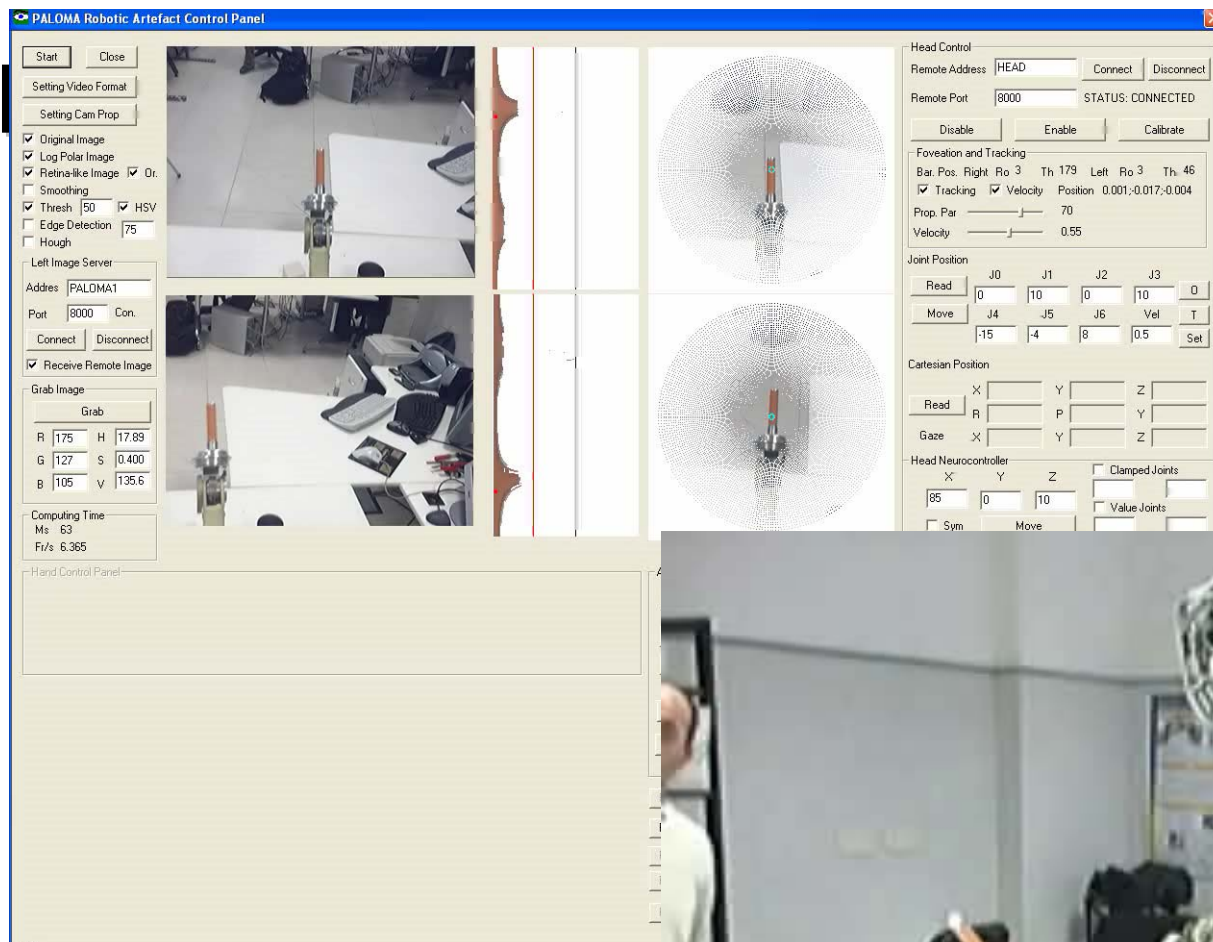

Pursuit Movement

Frame rate: 10 fps for both images
Head Control loop: 100 ms

Hand Tracking

Frame rate: 10 fps for both images
 Head Control loop: 100 ms
 Arm movement 0.2 m/s

Solution 2

Implementation of a biological model of head-eye coordination

The Artificial Model for horizontal motion

e

Experimental trials

Objectives:

1. To investigate the effectiveness of the bio-inspired paradigm to achieve an appropriate control of a multi-DOF robotic head
2. To verify if the proposed control paradigm is able to produce a motor output coherent with the reported patterns of eye-head coordination in humans

Experimental Methodology

In accordance to Goossens & Van Opstal two kinds of experiments were done:

- ***aligned experiments***: eyes and head of the robot were aligned at a straight head position.
- ***not aligned experiments***: the eyes of the robot were randomly deviated from the straight head position with an initial deviation in the range 20° - 55° .
- from the starting position the gaze shift was presented to the robot and the resulting displacements and timing of eye head movements were recorded through the proprioceptive sensors of the head

Experimental Trials

- **Aligned** Experiment:
horizontal saccadic movements of 45° on horizontal and vertical direction.
- **Not Aligned** experiment:
saccadic movement of 45° amplitude with an initial deviation of 25° in the same direction. Required movement for the eye was 20° whereas the head moved 45°
- 10 trials for each experiment
- Maximum velocities have been set to 400 deg/s and 300 deg/s respectively for eye yaw motion and eye tilt motion

Experimental Trials: horizontal saccades

Solution 3

Implementation of a bioinspired model of head-eye coordination based on learning

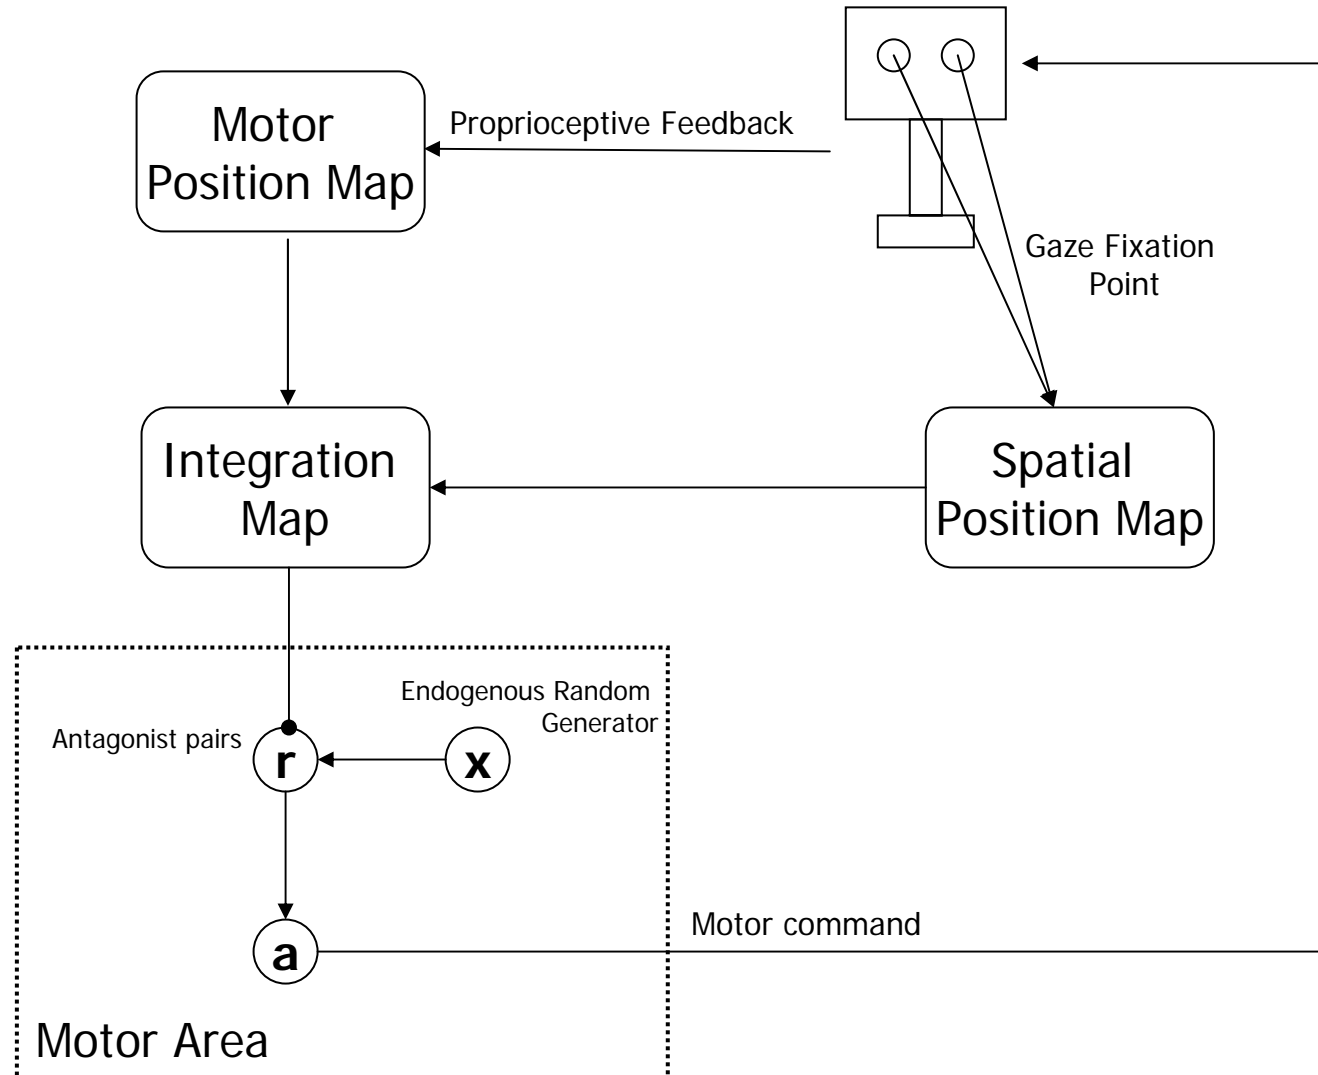

G. Asuni, G. Teti, C. Laschi, E. Guglielmelli, P. Dario, "A Robotic Head Neuro-controller Based on Biologically-Inspired Neural Models", *IEEE International Conference on Robotics and Automation – ICRA 2005*, Barcelona, Spain, April 18-22, 2005, pp.2373-2378.

Addressed Problem

To develop a control module that receives in input a target gaze position and provides in output a command sequence able to reach it

The proposed neural model

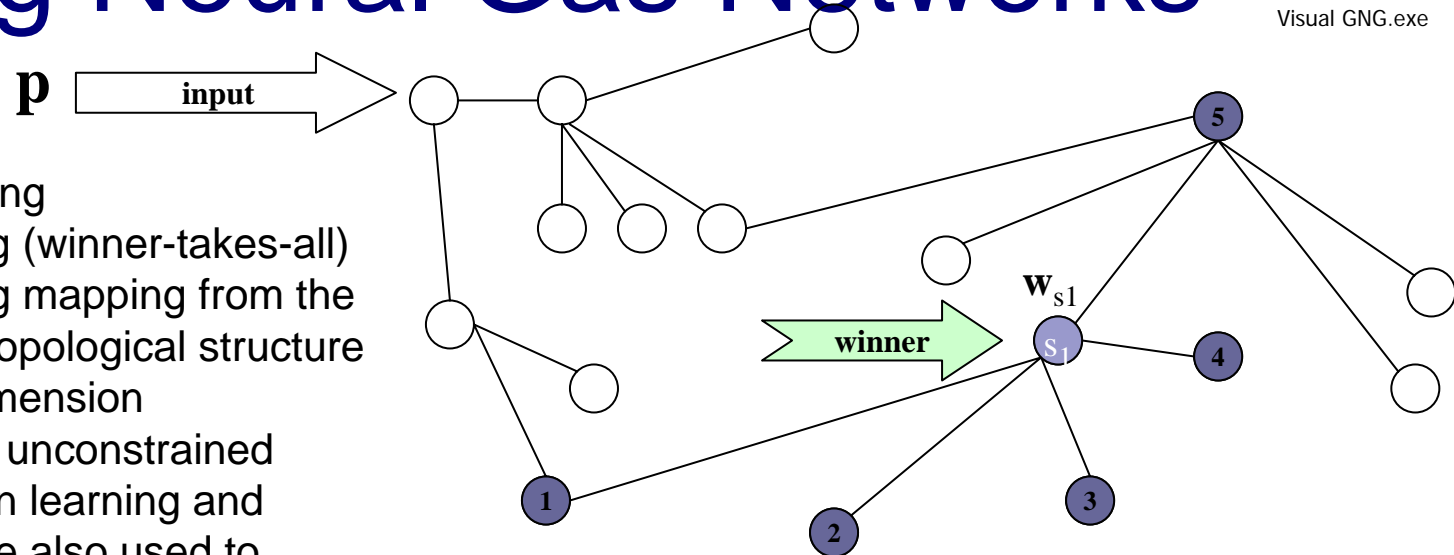

Implementation tools: Growing Neural Gas Networks

Visual GNG.exe

- Unsupervised learning
- Competitive learning (winner-takes-all)
- Topology-preserving mapping from the input space onto a topological structure of equal or lower dimension
- Network topology is unconstrained
- Competitive Hebbian learning and connection aging are also used to generate the topology
- Growth mechanism (the network size need not be predefined)
- The growth process can be interrupted when a user defined performance criterion has been fulfilled

\mathbf{w}_i is the weight vector associated to the unit i

Set of direct topological neighbors of the winner unit (S_1)

$$N_{s_1} = \{ \text{1} \text{ } \text{2} \text{ } \text{3} \text{ } \text{4} \text{ } \text{5} \}$$

Updating rules:

$$\begin{aligned} \mathbf{w}_{s_1} &= \mathbf{w}_{s_1} + \mathcal{E}_b (\mathbf{p} - \mathbf{w}_{s_1}) \\ \mathbf{w}_i &= \mathbf{w}_i + \mathcal{E}_n (\mathbf{p} - \mathbf{w}_i) \quad (\forall i \in N_{s_1}) \end{aligned}$$

Bernd Fritzke, "Growing Cell Structures - A Self-organizing Network for Unsupervised and Supervised Learning". ICSI TR-93-026, 1993. *Neural Networks* 7(9):1441-1460, 1994a

Testing phase

- After the training phase, given a target fixation point the system provides the joint rotations that drives the current gaze fixation point in the target point
- Three different modalities:
 1. Normal (without any constraint)
 2. With a clamped joint 0
 3. With symmetric angles for eye joints

All trials have been executed without additional learning

Experimental results: normal gazing

Initial posture

Final posture (normal)

Experimental results: robotic head (7 d.o.f)

Distance between the current gaze
fixation point and the target:
monotonic trend

Joint trajectory

Experimental results: gazing with a clamped joint

Final posture in normal mode

Final posture (clamped joint 0)

Experimental results: robotic head (7 d.o.f)

Joint trajectory: clamped joint 0

Experimental results: robotic head (7 d.o.f)

Joint trajectory: clamped joint 0 and joint 1

Experimental results: gazing with symmetric eye angles

Final posture in normal mode

Final posture with symmetric
angles for eye joints

Experimental results: robotic head (7 d.o.f)

Joint trajectory: symmetric angles for eye joints (vergence)

Validation of a model of gaze control (by Prof. Alain Berthoz, College de France, Paris)

- Implementation of the mapping from the polar coordinates in visual space to the superior colliculus coordinate system, according to the model

Validation of a model of gaze control (by Prof. Alain Berthoz, College de France)

- ❑ Implementation of the mapping from the polar coordinates in visual space to the superior colliculus coordinates system, according to the model
- ❑ Generation of saccade movements:
 - A stimulus of a given colour can be detected in the map and the coordinates calculated in the superior colliculus, in real time
 - These coordinates are sent to the gaze control model to calculate the velocity profile for gaze control
 - The velocity profiles are used to control the robot head to generate the saccade movements of the eyes
