```

A hand-drawn flowchart illustrating a process flow. The flow starts from a rectangle at the top left, goes down to another rectangle, then down to a third rectangle. From there, it branches: one path goes down to a fourth rectangle, then down to a fifth rectangle, and finally down to an oval. Another path goes right from the third rectangle to a sixth oval, then right to a seventh oval, and finally up to an eighth oval. A red number '1' is written next to the seventh oval.

## 15 - S-systems and T-systems

# Object

We study some “good” properties of S-systems

Free Choice Nets (book, optional reading)

<https://www7.in.tum.de/~esparza/bookfc.html>

# Petri nets: structural properties

# Structural properties

**Structural** (or **static**) properties  
do not depend on the initial marking  
(e.g., S-invariants, T-invariants, connectedness)

It is sometimes interesting to relate them to  
**behavioural** properties  
(i.e. that depend on the token game,  
like boundedness and liveness)

This way we can give **structural characterization** of  
behavioural properties for a whole class of nets  
(computationally less expensive to check)

# Interference of conflicts and synch

Typical situation:

initially t1 and t2 are not in conflict

but when t3 fires they are in conflict  
(the firing of t3 is not controllable)

How to rule this situation out?

# S-systems / S-nets

A Petri net is called **S-system** if every transition has one input place and one output place  
(S comes from *Stellen*, the German word for place)

This way any synchronization is ruled out

The theory of S-systems is very simple

# S-net: example

# T-systems / T-nets

A Petri net is called **T-system** if every place has one input transition and one output transition

This way all choices/conflicts are ruled out

T-systems are concurrent but deterministic

# T-net: example

# Question time

# Exercises

**S-nets**

**T-nets**

*S-systems*

# S-system

**Definition:** We recall that a net  $N$  is an **S-net** if each transition has exactly one input place and exactly one output place

$$\forall t \in T, \quad |\bullet t| = 1 = |t \bullet|$$

A system  $(N, M_0)$  is an **S-system** if  $N$  is an S-net

# Take-home message

**Any** workflow net  $N$  that is an S-net  
is **safe and sound**

# Fundamental property of S-systems

**Observation:** each transition  $t$  that fires removes exactly one token from some place  $p$  and inserts exactly one token in some place  $q$  ( $p$  and  $q$  can also coincide)

**The overall number of tokens in the S-net is an invariant under any firing.**

# Notation: token count

$$M(P) = \sum_{p \in P} M(p)$$

Example

$$P = \{p_1, p_2, p_3\} \quad M = 2p_1 + 3p_2 \quad M(P) = 2 + 3 + 0 = 5$$

# Question time

$$M_0(P) = ?$$

$$M_0 = p_1 + 2p_2 + 3p_5$$

$$M_0(P) = M_0(p_1) + M_0(p_2) + M_0(p_4) + M_0(p_5)$$

$$M_0(P) = 6$$

# Fundamental property of S-systems

**Proposition:** Let  $(P, T, F, M_0)$  be an S-system.  
If  $M$  is a reachable marking, then  $M(P) = M_0(P)$

We show that for any  $M \xrightarrow{\sigma} M'$  we have  $M'(P) = M(P)$

base ( $\sigma = \epsilon$ ): trivial ( $M' = M$ )

induction ( $\sigma = \sigma' t$  for some  $\sigma' \in T^*$  and  $t \in T$ ):

Let  $M \xrightarrow{\sigma'} M'' \xrightarrow{t} M'$ .

By inductive hypothesis:  $M''(P) = M(P)$

By definition of S-system:  $|\bullet t| = |t \bullet| = 1$

Thus,  $M'(P) = M''(P) - |\bullet t| + |t \bullet| = M(P) - 1 + 1 = M(P)$

# Question time

Is the marking  
 $M = p_2 + 4p_4 + 2p_5$   
reachable?

# Question time

Is the marking  
 $M = p_2 + 4p_4 + 2p_5$   
reachable?

No:

S-system

$$M_0(P) = 6 \neq 7 = M(P)$$

# A consequence of the fundamental property

**Corollary:** Any S-system is bounded

Let  $M \in [M_0]$ .

By the fundamental property of S-systems:  $M(P) = M_0(P)$ .

Then, for any  $p \in P$  we have  $M(p) \leq M(P) = M_0(P)$ .

Thus the S-system is  $k$ -bounded for any  $k \geq M_0(P)$ .

$$M(P) = \sum_{p \in P} M(p)$$

# S-invariants of S-nets

**Proposition:** Let  $N=(P,T,F)$  be a (connected) S-net.  
 $I$  is an S-invariant of  $N$  **iff**  $I=[k \dots k]$  for some value  $k$

S-invariance  $\forall t \in T, \sum_{p \in \bullet t} I(p) = \sum_{p \in t \bullet} I(p)$

S-nets  $\forall t \in T, |\bullet t| = |t \bullet| = 1$

Let  $\bullet t = \{p^t\}$  and  $t \bullet = \{p_t\}$

$$\forall t \in T, I(p^t) = I(p_t)$$

# Question time

Which of the following are S-invariants? (why?)

$$\begin{bmatrix} 1 & 1 & 1 & 1 \end{bmatrix}$$
$$\begin{bmatrix} 2 & 2 & 1 & 1 \end{bmatrix}$$
$$\begin{bmatrix} 2 & 2 & 2 & 2 \end{bmatrix}$$

# Liveness theorem for S-systems

**Theorem:** An S-system  $(N, M_0)$  is live iff  $N$  is strongly connected and  $M_0$  marks at least one place

$\Rightarrow$ ) (quite obvious)

$(N, M_0)$  is live by hypothesis and bounded (because S-system). By the strong connectedness theorem,  $N$  is strongly connected.

Since  $(N, M_0)$  is live, then  $M_0 \xrightarrow{t}$  for some  $t$ .

Assume  $\bullet t = \{p\}$ . Thus,  $M_0(p) \geq 1$ .

# Liveness theorem for S-systems

**Theorem:** An S-system  $(N, M_0)$  is live iff  $N$  is strongly connected and  $M_0$  marks at least one place

$\Leftarrow$ ) (more interesting)

Take any  $M \in [M_0]$  and  $t \in T$ .

We want to find  $M' \in [M]$  such that  $M' \xrightarrow{t}$ .

Take  $p_1 \in P$  such that  $M(p_1) \geq 1$  (it exists, because  $M(P) = M_0(P) \geq 1$ ).

By strong connectedness: there is a path from  $p_1$  to  $t_n = t$

$(p_1, t_1)(t_1, p_2)(p_2, t_2) \dots (p_n, t_n)$

By definition of S-system:  $\bullet t_i = \{p_i\}$  and  $t_i \bullet = \{p_{i+1}\}$ .

Thus,  $M \xrightarrow{\sigma} M' \xrightarrow{t}$  for  $\sigma = t_1 t_2 \dots t_{n-1}$ .

# Question time

Is this S-system live?

# Question time

Is this S-system live?

Yes:  
S-system  
strongly connected  
 $M_0(P) > 0$

# Question time

Is this S-system live?

How to enable t2?  
just find a path

# Reachability lemma for S-nets

**Lemma:** Let  $(P,T,F)$  be a strongly connected S-net.  
If  $M(P) = M'(P)$ , then  $M'$  is reachable from  $M$

**Intuitively:**

M and M' has the same number of tokens  
but maybe they are in different places

# Reachability lemma for S-nets

**Lemma:** Let  $(P, T, F)$  be a strongly connected S-net.  
If  $M(P) = M'(P)$ , then  $M'$  is reachable from  $M$

if there is only **one** token in the wrong place

**Intuitively:**

we need to move the token from p to q  
by strong connectedness we have a path from p to q  
by firing the transitions along the path we succeed

# Reachability lemma for S-nets

**Lemma:** Let  $(P,T,F)$  be a strongly connected S-net.  
If  $M(P) = M'(P)$ , then  $M'$  is reachable from  $M$

if there are **many**  
(**n**) tokens in the  
wrong places

# Reachability lemma for S-nets

**Lemma:** Let  $(P,T,F)$  be a strongly connected S-net.  
If  $M(P) = M'(P)$ , then  $M'$  is reachable from  $M$

if there are **many**  
(**n**) tokens in the  
wrong places

**Intuitively:**  
we move **one** of them...  
and inductively the remaining **n-1**

# Reachability lemma for S-nets

**Lemma:** Let  $(P,T,F)$  be a strongly connected S-net.  
If  $M(P) = M'(P)$ , then  $M'$  is reachable from  $M$

We proceed by induction on  $M(P)$

**base**  $(M(P) = M'(P) = 0)$ : trivial ( $M' = M$ )

**induction**  $(M(P) = M'(P) > 0)$ :

Let  $p, p' \in P$  be such that  $M(p) > 0$  and  $M'(p') > 0$ .

Let  $K = M - p$  and  $K' = M' - p'$ .

Clearly  $K'(P) = K(P) < M(P) = M'(P)$ .

By inductive hypothesis:  $\exists \sigma, K \xrightarrow{\sigma} K'$

By strong connectedness: there is a path from  $p_0 = p$  to  $p_n = p'$

$(p_0, t_1)(t_1, p_1)(p_1, t_2) \dots (t_n, p_n)$

By definition of S-system:  $\bullet t_i = \{p_{i-1}\}$  and  $t_i \bullet = \{p_i\}$ .

Thus,  $p = p_0 \xrightarrow{\sigma'} p_n = p'$  for  $\sigma' = t_1 t_2 \dots t_n$ .

By the monotonicity lemma:  $M = K + p \xrightarrow{\sigma} K' + p \xrightarrow{\sigma'} K' + p' = M'$

Only for the  
interested  
reader!

# Reachability Theorem for S-systems

**Theorem:** Let  $(P, T, F, M_0)$  be a live S-system.  
A marking  $M$  is reachable **iff**  $M(P) = M_0(P)$

$\Rightarrow$ ) Follows from the fundamental property of S-systems

$\Leftarrow$ ) By the liveness theorem for S-systems, the S-net is strongly connected.

We conclude by applying the previous reachability lemma for S-systems.

Is it an S-net? Is it sound?

Yes:  
WF net  
S-net  
=> sound

T-systems

# T-system

**Definition:** We recall that a net  $N$  is a **T-net** if each place has exactly one input transition and exactly one output transition

$$\forall p \in P, \quad |\bullet p| = 1 = |p \bullet|$$

A system  $(N, M_0)$  is a **T-system** if  $N$  is a T-net

# T-net $N^*$

Is the following conjecture true?

A workflow net  $N$  is a T-net  
iff  $N^*$  is a T-net

# T-net $N^*$

Is the following conjecture true?

A workflow net  $N$  is a T-net  
iff  $N^*$  is a T-net

No, a workflow net cannot be a T-net because  
the place  $i$  has no incoming arc  
and the place  $o$  has no outgoing arc

(but  $N^*$  can be a T-net)

# T-net $N^*$ : example

$N$  is a workflow net  
but not a T-net

$N^*$  is a T-net  
(not a workflow net)

# Take-home message

**Any** workflow net  $N$  such that  $N^*$  is a T-net  
is **safe and sound**  
iff  
every **circuit** of  $N^*$  is marked

# Fundamental property of T-systems

The token count of a circuit is invariant under any firing.

# Notation: token count of a circuit

Let  $\gamma = (x_1, y_1)(y_1, x_2)(x_2, y_2) \dots (x_n, y_n)$  be a circuit.

Let  $P|_{\gamma} \subseteq P$  be the set of places in  $\gamma$ .

$$M(\gamma) = M(P|_{\gamma}) = \sum_{p \in P|_{\gamma}} M(p)$$

We say that  $\gamma$  is **marked at**  $M$  if  $M(\gamma) > 0$

# Example

$\gamma_1 = \text{prod1 busy prod1end prod1free prod1start}$

$\gamma_2 = \text{freeslot prod1end itembuffer cons1start}$

$\gamma_3 = \text{cons1 busy cons1end cons1free cons1start}$

$$M(\gamma_1) = 4$$

$$M(\gamma_2) = 2$$

$$M(\gamma_3) = 3$$

# Question time

Trace two circuits over the T-system below

# Question time

Trace two circuits over the T-system below

# Fundamental property of T-systems

**Proposition:** Let  $\gamma$  be a circuit of a T-system  $(P, T, F, M_0)$ .  
If  $M$  is a reachable marking, then  $M(\gamma) = M_0(\gamma)$

Take any  $t \in T$ : either  $t \notin \gamma$  or  $t \in \gamma$ .

If  $t \notin \gamma$ , then no place in  $\bullet t \cup t\bullet$  is in  $\gamma$   
(otherwise, by definition of T-nets,  $t$  would be in  $\gamma$ ).

Then, an occurrence of  $t$  does not change the token count of  $\gamma$ .

If  $t \in \gamma$ , then exactly one place in  $\bullet t$  and one place in  $t\bullet$  are in  $\gamma$ .  
Then, an occurrence of  $t$  does not change the token count of  $\gamma$ .

# Example

$$M_0 = [0 \ 4 \ 2 \ 0 \ 3 \ 0]$$

$$M = [2 \ 2 \ 1 \ 2 \ 2 \ 1] \quad \text{Not reachable!}$$

# Example

$$M_0 = [0 \ 4 \ 2 \ 0 \ 3 \ 0]$$

$$M' = [2 \ 1 \ 1 \ 1 \ 2 \ 2] \quad \text{Not reachable!}$$

# Question time

Is the marking  $p_1 + 2p_2$  reachable? (why?)

# Question time

Is the marking  $p_1 + 2p_2$  reachable? (why?)

No  
the token count in  
the left (blue) circuit  
must remain 2  
and  
the token count in  
the right (red) circuit  
must remain 1

# T-invariants of T-nets

**Proposition:** Let  $N=(P,T,F)$  be a (connected) T-net.  $J$  is a T-invariant of  $N$  iff  $J=[k \dots k]$  for some value  $k$

(the proof is dual to the analogous proposition for S-invariants of S-nets)

# T-systems: an observation

Notably, computation in T-systems is concurrent, but essentially deterministic: the firing of a transition  $t$  in  $M$  cannot disable another transition  $t'$  enabled at  $M$

Determination of control:  
the transitions responsible for enabling  $t$  are exactly one for each input place of  $t$

# Boundedness in strongly connected T-systems

**Lemma:** If a T-system  $(N, M_0)$  is strongly connected, then it is bounded

Let  $\Gamma$  be the set of the circuits of  $N$  and let  $k = \max_{\gamma \in \Gamma} M_0(\gamma)$ .

Since  $N$  is strongly connected, every place  $p$  belongs to some circuit  $\gamma_p$ .

By the fundamental property of T-systems: token count of  $\gamma_p$  is invariant.

Thus, for any reachable marking  $M$ , we have  $M(p) \leq M(\gamma_p) = M_0(\gamma_p) \leq k$ .  
Hence the net is  $k$ -bounded.

# Safeness in strongly connected T-systems

**Corollary:** If a T-system  $(N, M_0)$  is strongly connected and  $M_0(P)=1$ , then it is safe

Let  $\Gamma$  be the set of the circuits of  $N$  and let  $k = \max_{\gamma \in \Gamma} M_0(\gamma) = 1$

Since  $N$  is strongly connected, every place  $p$  belongs to some circuit  $\gamma_p$ .

By the fundamental property of T-systems: token count of  $\gamma_p$  is invariant.

Thus, for any reachable marking  $M$ , we have  $M(p) \leq M(\gamma_p) = M_0(\gamma_p) \leq k$ .  
Hence the net is  $k$ -bounded. =1

# Safeness in strongly connected T-systems

**Corollary:** If a T-system  $(N, M_0)$  is strongly connected and for any circuit  $\gamma$   $M_0(\gamma) \leq 1$ , then it is safe

Let  $\Gamma$  be the set of the circuits of  $N$  and let  $k = \max_{\gamma \in \Gamma} M_0(\gamma) \leq 1$

Since  $N$  is strongly connected, every place  $p$  belongs to some circuit  $\gamma_p$ .

By the fundamental property of T-systems: token count of  $\gamma_p$  is invariant.

Thus, for any reachable marking  $M$ , we have  $M(p) \leq M(\gamma_p) = M_0(\gamma_p) \leq k$ .  
Hence the net is  $k$ -bounded.  $\leq 1$

# Question time

Is the T-systems below bounded? (why?)

# Question time

Is the T-systems below bounded? (why?)

Strongly connected  
=> bounded

# Question time

Is the T-systems below safe? (why?)

# Question time

Is the T-systems below safe? (why?)

Strongly connected  
+  $M_0(P)=1$   
 $\Rightarrow$  safe

# Question time

Is the T-systems below safe? (why?)

# Question time

Strongly connected  
+  $\forall \gamma . Mo(\gamma) \leq 1$   
 $\Rightarrow$  safe

# Liveness theorem for T-systems

**Theorem:** A T-system  $(N, M_0)$  is live  
**iff** every circuit of  $N$  is marked at  $M_0$

$\Rightarrow$ ) (quite obvious)

By contradiction, let  $\gamma$  be a circuit with  $M_0(\gamma) = 0$ .

By the fundamental property of T-systems:  $\forall M \in [M_0 \rangle, M(\gamma) = 0$ .

Take any  $t \in T|_\gamma$  and  $p \in P|_\gamma \cap \bullet t$ .

For any  $M \in [M_0 \rangle$ , we have  $M(p) = 0$ .

Hence  $t$  is never enabled and the T-system is not live.

# Liveness theorem for T-systems

**Theorem:** A T-system  $(N, M_0)$  is live  
**iff** every circuit of  $N$  is marked at  $M_0$

$\Leftarrow$  ) (more involved)

Take any  $t \in T$  and  $M \in [M_0]$ .

We need to show that some marking  $M'$  reachable from  $M$  enables  $t$ .

The key idea is to collect the places that control the firing of  $t$ :

$p \in P_{M,t}$  if there is a path from  $p$  to  $t$  through places unmarked at  $M$ .

We then proceed by induction on the size of  $P_{M,t}$ .

Rest of the proof left to  
your ingenuity

T-system: T-invariant  $\mathbf{J} \Leftrightarrow \mathbf{J} = [k \ k \ \dots \ k]$

# Exercises

Which are the circuits of the T-system below?

Is the T-system below live? (why?)

Which places are bounded? (why?)

Assign a bound to each bounded place.

# Exercises

Which are the circuits of the T-system below?

Is the T-system below live? (why?)

Which places are bounded? (why?)

Assign a bound to each bounded place.

$M_0(\gamma) > 0$  for all circuits  $\gamma \iff$  LIVE

# Exercises

Which are the circuits of the T-system below?

Is the T-system below live? (why?)

Which places are bounded? (why?)

Assign a bound to each bounded place.

$$\exists i. p \in \gamma_i \iff p \text{ bounded}$$

# Consequences on workflow nets

**Theorem:** If  $N$  is a workflow net s.t.  $N^*$  is a T-system then  
 $N$  is safe and sound **iff**  
every circuit of  $N^*$  is marked

$N$  workflow net  $\Rightarrow N^*$  strongly connected

$N^*$  strongly connected + T-system  $\Rightarrow N^*$  bounded

$N^*$  strongly connected + T-system +  $M_0(P)=1 \Rightarrow N^*$  safe

every circuits of  $N^*$  is marked  $\Leftrightarrow N^*$  live

# Exercise

Is the net below a workflow net?  
Is it sound?

# Exercise

Is the net below a workflow net? **Yes**

Is it sound?  **$N^*$  is a T-net**

**Every circuit is marked**

**$\Rightarrow$  Yes**

# Exercise

Is the net below a workflow net?  
Is it sound?

# Exercise

Is the net below a workflow net? **Yes**

# Is it sound?

# N\* T-net

Unmarked circuit  
=> No
